THE FUNDAMENTALS OF ETHICS
SECOND EDITION

THE WORST—YES ALSO CONCISE—
INTRODUCTION TO MORAL PHILOSOPHY

"The writing is as clear as any I've seen in a philosophy textbook."
—Jeffrey Brand-Ballard, George Washington University

In *The Fundamentals of Ethics*, Second Edition, author Russ Shafer-Landau employs a uniquely engaging writing style to introduce students to the essential ideas of moral philosophy. Offering more comprehensive coverage of the good life, normative ethics, and metaethics than any other text of its kind, this book also addresses issues that are often omitted from other texts, such as the doctrine of doing and allowing, the doctrine of double effect, ethical particularism, the desire-satisfaction theory of well-being, and moral error theory. Shafer-Landau carefully reconstructs and analyzes dozens of arguments in depth, at a level that is understandable to students with no prior philosophical background.

NEW TO THE SECOND EDITION

- Discussion questions at the end of every chapter
- New, real-life extended examples
- Greatly expanded coverage of moral rights (in Chapter 8) and of membership in the moral community (in Chapter 9)
- A new discussion of skepticism about morality in the Introduction
- An all-new Companion Website at www.oup.com/us/shafer-landau with quizzes and other helpful resources

Ideal for courses in introductory ethics and contemporary moral problems, this book can be used as a stand-alone text or with the author's companion reader, *The Ethical Life: Fundamental Readings in Ethics and Moral Problems*, Second Edition, which offers original readings on ethical theory and contemporary moral problems.

ABOUT THE AUTHOR

RUSS SHAFER-LANDAU is Professor of Philosophy and Chair of the Department at the University of Wisconsin-Madison. He is the editor of *The Ethical Life: Fundamental Readings in Ethics and Moral Problems*, Second Edition (OUP, 2011), which is designed to be used along with this textbook.

This book is divided into three parts—one on the Good Life, another on Doing the Right Thing, and the last on the Status of Morality. You can read these parts in any order. Many will want to begin at the end, for instance, with a discussion of whether morality is a human invention, or is in some way objective. Some will prefer to start in the middle, asking about the supreme principle of morality (and whether there is any such thing). And others may want to begin at the beginning, by thinking about human well-being and the quality of life. Each part can be understood independently of the others, though there are of course many points of connection across the three main branches of moral philosophy. No matter where you begin, there are footnotes in most chapters that provide cross-references to relevant discussions elsewhere in the book.

When beginning a new area of study, you’re bound to encounter some unfamiliar jargon. I’ve tried to keep this to a minimum, and I suppose that you can be thankful that we’re doing ethics here, rather than physics or anatomy. I define each technical term when I first use it, and have also put together a glossary, which appears at the end of the book. Each specialized term that appears in boldface has an entry there.

You may be interested enough in what you read here that you’ll want to continue your studies in moral philosophy. There is a natural place to begin—the companion volume to this book, The Ethical Life, described later in this preface. I have also compiled a list of Suggestions for Further Reading for each chapter or pair of chapters. This list appears at the end of
the book, just before the glossary. I have selected the readings with an eye to what might be accessible and interesting to those just beginning their study of moral philosophy.

There is so much that is fascinating about ethics. This tempts a textbook author to go on and on. And yet there are page limits that must be respected. Deciding what to keep and what to leave on the editing floor has been a real challenge. Perhaps you think that the balance hasn't always been well struck. Perhaps you find certain discussions unclear or boring. I'd like to know about this. The best way to get in touch is by e-mail: shaferlandau@wisc.edu.

New to the Second Edition

I'm very pleased that students and instructors have found this book useful enough to warrant a new edition. In the interests of maintaining continuity with the first edition, I have tried to introduce only relatively modest changes. Here is a brief list:

- **New Discussions**: There is a new discussion of skepticism about morality in the Introduction. Existing discussions of moral rights (in chapter 8), and of membership in the moral community (in chapter 9), have been greatly extended.

- **New Arguments**: There are new arguments given in chapter 5 (on God's Creation of Morality), chapter 9 (The Argument from Marginal Cases), chapter 10 (The Argument from Injustice), chapter 15 (The Particularist Argument), and chapter 19 (The Contradiction Problem for Subjectivism). There are now fifty arguments reconstructed and analyzed in the book.

- **New Examples**: A number of new, real-life examples have been added to the text, reinforcing the importance of the theories under discussion. These appear in chapter 4 (regarding unreasonable desires), chapter 7 (Ross McGinniss's self-sacrifice), chapter 9 (on animal cruelty), chapter 10 (Paul Farmer's aid work), chapter 14 (the case of Marlena Garcia-Esperat), chapter 15 (Rabbi Efrati's judgment), and chapter 19 (the honor killing of Nuran Halitogullari).

- **Discussion Questions**: Every chapter now ends with discussion questions designed to help students identify the central themes and arguments of the chapter.

And, perhaps most importantly,

- There is now a comprehensive **Companion Website and an Instructor's Manual** associated with this book. These contain loads of helpful material — so much so that they deserve a brief summary all their own.

**Instructor's Manual and Companion Website**

There is now a brand-new website designed to support this book. The site offers about 250 multiple-choice questions for students to use so that they may test their comprehension of the materials here. The website also contains a complete online Instructor's Manual. The manual itself has chapter summaries for all twenty-one chapters; over 100 essay questions; over 200 multiple-choice questions (in addition to those available elsewhere on the website); about 200 PowerPoint slides to help organize lectures; and a variety of web links that point students to sites with content that supplements the material in this book. You can visit the website at: www.oup.com/us/shafer-landau.

The work for this site was undertaken by my stellar research assistant, Justin Horn. I am very grateful for his dedicated efforts in making this a first-rate resource.

**A Note on the Companion Volume**

There are two kinds of introductory books. One is the sort that you have in your hands right now. It's one person's take on the subject, and your fate, dear reader, depends on how reliable and engaging that author happens to be. I have tried to be both, but you will have to be the judge of that. There are benefits to a single-authored book. At its best, you'll get a coherent narrative that draws connections between various discussions. You'll be handed the important highlights, be introduced to the really big ideas, and get an accurate map of the relevant terrain.

But there is another approach, equally valid. And that is to hear what the major figures in the area have to say, to familiarize yourself with the original voices in the field. For those with an interest in going this route, I have put together a companion volume, *The Ethical Life: Fundamental Readings in Ethics and Moral Problems*, which allows you to do just that.

*The Ethical Life* gathers together readings from nearly forty authors on the main subjects that are covered here. There are many entries on the good life, on the central ethical theories, and on the status of morality. There are also twenty additional readings on pressing moral problems,
such as the death penalty, terrorism, abortion, torture, animal rights, and other urgent matters. There are many resources that can help readers through that book—introductions to each reading, study questions, suggestions for further reading, and a website with sample quizzes, essay questions, and lots of extra materials.

The fullest introduction to ethics would include both of these approaches. The Ethical Life will give you lots of primary sources, and Fundamentals can help you to place them in context, clearly setting out their ideas and providing some critical evaluation of their strengths and weaknesses. For those who are content to take my word for it, Fundamentals will be enough. For those who want to see what other philosophers have to say about these important matters, The Ethical Life might be a good place to start. And for those of you attracted by both approaches, working through each in tandem with the other can provide a well-rounded picture of what moral philosophy is all about.

Acknowledgments

I wrote this book because my editor, Robert Miller, asked me to. Well, not really. He asked, and I refused. He did it again, and I refused. Obviously, I did finally give in. I want to thank Robert for his persistence, but much more importantly for his unflagging enthusiasm and his uncommon good sense. His assistant, Christina Mancuso, has been a dream to work with.

One of Robert’s many kindnesses was to solicit feedback from so many talented philosophers. The manuscript of the first edition was vastly improved by the sharp insights of Ralph Baergen, Stacy Bautista, Tom Carson, Michael Cholbi, David Detmer, Matthew Eshelman, Steve Finlay, Dan Hausman, Richard Haynes, Ryan Hickerson, and Keith Allen Korcz. A superstar trio—Tyler Doggett, Christian Miller, and David Sobel—deserve special mention for having devoted an extraordinary amount of serious attention to what was, at that point, my work in progress.

In preparing this updated version, I have been greatly helped by the acute advice of Jeffrey Brand-Ballard (George Washington University), Robert Fischer (University of Illinois, Chicago), Deke Gould (LeMoyne College), Christopher Grau (Clemson University), Craig Hanks (Texas State University), Darren Hibbs (Nova Southeastern University), Richard Hine (University of Connecticut), Avery Kolers (University of Louisville), Robert Lane (University of West Georgia), Patrick Linden (Hunter College), Jessica Logue (University of Portland), Eugene Marshall (Wellesley College), Michael McKenna (University of Arizona), Brian Merrill (Brigham Young University), Nathan Nobis (Morehouse College), and Philip Robbins (University of Missouri). I am very grateful to these fine philosophers for having sent so many kind and constructive suggestions my way.

When my children were small, I would sometimes take a moment to remind myself of how lucky I was. My kids were healthy. And they were adorable. But I was sure that our joys together would be short-lived. I expected my sweet little children to turn into sullen and alienated teens, moping around the house and maintaining complete radio silence. That’s a good description of me, some thirty years ago, and I just assumed that my son and daughter would follow suit. They didn’t. I’ve never been happier to have been proven wrong.

This book is dedicated to my beautiful children, Max and Sophie.

INTRODUCTION

The Lay of the Land

There is so much to know about our world. And for those who are the least bit curious, we have more resources than ever to give us the insights we seek. We can turn to a variety of scientists, doctors, economists, historians, and journalists to help us better understand ourselves, our world, and our place within it.

But there is a set of vital questions that such experts will never answer. These are questions about how we ought to live. Sure, financial advisors can tell us how we ought to invest our money. Personal trainers can advise us on getting in shape. Career counselors can steer us in one direction or another. But if we are interested instead in what our guiding ideals should be, in what sort of life is worth living, in how we should treat one another, then we must turn to philosophy. Ethics—also known as moral philosophy—is the branch of knowledge concerned with answering such questions.

The field of ethics is vast, and—bad news first—there is no chance of covering all of its interesting and important issues within these pages. In selecting the topics for treatment, I have chosen those that seem to me most central. These can be grouped under three headings, each representing a core area of moral philosophy:
1. **Value theory**: What is the good life? What is worth pursuing for its own sake? How do we improve our lot in life?

2. **Normative ethics**: What are our fundamental moral duties? Which character traits count as virtues, which as vices, and why? Who should our role models be? Do the ends always justify the means, or are there certain types of action that should never be done under any circumstances?

3. **Metaethics**: What is the status of moral claims and advice? Can ethical theories, moral principles, or specific moral verdicts be true? If so, what makes them true? Can we gain moral wisdom? If so, how? Do we always have good reason to do our moral duty?

The structure of this book mirrors this threefold division. The first part is focused on value theory, which is that area of ethics concerned with identifying what is valuable in its own right, and explaining the nature of well-being. We ask, for instance, about whether happiness is the be-all and end-all of a good life, the only thing desirable for its own sake. And, naturally, we'll consider views that deny this, including, most importantly, the theory that tells us that getting what we want—whatever we want—is the key to the good life.

Then it's off to normative ethics, which is devoted to examining our moral relations with one another. Who counts—are animals, ecosystems, or fetuses morally important in their own right? Is there a fundamental moral rule, such as the **golden rule**, that can justify all of our specific moral duties? What role do virtue, self-interest, and justice play in morality? Are we ever allowed to break the moral rules? If so, when and why? These are among the most important questions taken up in normative ethics.

Finally, to metaethics. This part of moral philosophy asks questions about the other two. Specifically, it asks about the status of ethical claims, rather than about their content. We all have views about what is right and good. Are these just matters of taste? Is moral authority based on personal approval? Social customs? God's commands? Or none of the above? Is morality in more or less good working order, or is it just a convenient fiction that keeps us in our place? These are the questions that we will take up in the last section of the book.

---

1. All technical terms and phrases that appear in **boldface** are defined in the Glossary at the end of the book.
standards are correct only relative to individuals or societies, is deeply controversial. There are lots of problems with such views. Some of these problems may be devastating.

As a result, it would be a serious mistake just to assume that morality is a fiction, or that personal or cultural opinion is the ultimate measure of what is right and wrong. We must follow the arguments where they lead. They may indeed lead us ultimately to embrace such positions. But they might not. And we can't know one way or the other until we've actually done the hard work.

Since I really love this part of ethics—the metaethical part—I can't resist saying just a bit more here. In my experience, most of those who harbor serious doubts about morality base their skepticism on one or more of the following considerations:

(A) Individuals constantly disagree about what's right and wrong, and societies do, too. If there were some objective truth in ethics, then we should expect all really smart people to agree on it. They don't. So there is no objective truth in ethics.

(B) There are universally correct moral standards only if God exists. But God doesn't exist, so ethics is just a "human construct."

(C) Science tells us the truth about the world, and science says nothing about what's right and wrong. And that's because nothing really is right or wrong.

(D) If there were a universal ethic, then that would make it okay for some people to impose their own views on others. But that's not okay at all. Therefore there is no universal ethic.

(E) If there were objective moral rules, then it would always be wrong to break them. But every rule admits of exceptions; no moral rule is absolute. That shows that we do make up the moral rules after all.

This is going to sound like cheating, but here goes: every single one of these arguments is problematic. I'm not going to defend that claim right now—that's what the last three chapters of this book are for. So I don't expect you to believe me (yet). Still, there is a lesson here: until these (or other) arguments are laid out with care and successfully defended, we are in no position to assume that the skeptics about morality are right.

I think you'll soon see that we can make a lot of progress in our moral thinking. And even if morality is in some way a human invention, there is still lots to learn, and many ways to make mistakes when thinking about what is good and right. It's important to avoid these errors. Doing moral philosophy can help with this.

Look at it this way. Lots of people believe that when it comes to art, beauty is in the eye of the beholder—there are no objective, universal standards of good taste. Suppose that's true. And suppose that morality is just like art in this respect. Still, our tastes can be educated and improved. Many people are much wiser than I am about music and painting, for instance. Even if there are no universal standards of good taste, it would be silly of me to pass up a chance to talk with them. Why should I dismiss their opinions and refuse to hear them out? I'm no genius. Maybe I could learn a thing or two.

That's exactly the right attitude to take about ethics. Especially when so much is at stake—the very quality of our life and our relations with others—it would be terrible to close our minds to new and challenging ideas. Those who have thought so hard about the central questions of existence may well have something to teach us.

I encourage you to resist the diagnosis that in ethics, anything goes. As you'll see, good moral thinking is disciplined thinking. There are many ways that we can go wrong in our moral reflections, and failure here can have the most disastrous results. Though it is sometimes hard to know when we have got it right in ethics, it is often very easy to know when we (or others) have made a mistake. There are clear cases of people ruining their lives, or doing morally horrific things. We should keep that in mind before siding too quickly with a skepticism that says that all moral views are as good as every other.

Ethical Starting Points

One of the puzzles about moral thinking is knowing where to begin. Some skeptics about morality deny that there are any proper starting points for ethical reflection. They believe that moral reasoning is simply a way of rationalizing our biases and gut feelings. This outlook encourages us to be lax in moral argument and, worse, supports an attitude that no moral views are any better than others. While this sort of skepticism might be true, we shouldn't regard it as the default view of ethics. We should accept it only as a last resort.

In the meantime, let's consider some fairly plausible ethical assumptions, claims that can get us started in our moral thinking. The point of the exercise is to soften you up to the idea that we are not just spinning our
wheels when thinking morally. There are reasonable constraints that can
guide us when thinking about how to live. Here are some of them:

• *Neither the law nor tradition is immune from moral criticism.* The law
does not have the final word on what is right and wrong. Neither
does tradition. Actions that are legal, or customary, are sometimes
morally mistaken.
• *Everyone is morally fallible.* Everyone has some mistaken ethical
views, and no human being is wholly wise when it comes to moral
matters.
• *Friendship is valuable.* Having friends is a good thing. Friendships
add value to your life. You are better off when there are people you
care deeply about, and who care deeply about you.
• *We are not obligated to do the impossible.* Morality can demand only
so much of us. Moral standards that are impossible to meet are
illegitimate. Morality must respect our limitations.
• *Children bear less moral responsibility than adults.* Moral responsibi-
ity assumes an ability on our part to understand options, to make
decisions in an informed way, and to let our decisions guide our be-
havior. The fewer of these abilities you have, the less blameworthy
you are for any harm you might cause.
• *Justice is a very important moral good.* Any moral theory that treats
justice as irrelevant is deeply suspect. It is important that we get what
we deserve, and that we are treated fairly.
• *Deliberately hurting other people requires justification.* The default
position in ethics is this: do no harm. It
is sometimes morally
acceptable to harm others, but there must be an excellent reason for
doing so.
• *Equals ought to be treated equally.* People who are alike in all relevant
respects should get similar treatment. When this fails to happen—
when racist or sexist policies are enacted, for instance—then some-
ing has gone wrong.
• *Self-interest isn't the only ethical consideration.* How well-off we are is
important. But it isn't the only thing of moral importance. Morality
sometimes calls on us to set aside our own interests for the sake of
others.
• *Agony is bad.* Excruciating physical or emotional pain is bad. It may
sometimes be appropriate to cause such extreme suffering, but doing
so requires a very powerful justification.

• *Might doesn't make right.* People in power can get away with lots of
things that the rest of us can't. That doesn't justify what they do. That
a person can escape punishment is one thing—whether his actions
are morally acceptable is another.
• *Free and informed requests prevent rights violations.* If, with eyes
wide open and no one twisting your arm, you ask someone to do
something for you, and she does it, then your rights have not been
violated—even if you end up hurt as a result.

There are a number of points to make about these claims.
First, this short list isn't meant to be exhaustive. It could be made
much longer.

Second, I am not claiming that the items on this list are beyond criti-
cism. I am saying only that each one is very plausible. Hard thinking might
weaken our confidence in some cases. The point, though, is that without
such scrutiny, it is perfectly reasonable to begin with the items on this list.

Third, many of these claims require interpretation in order to apply
them in a satisfying way. When we say, for instance, that equals ought to be
treated equally, we leave all of the interesting questions open. (What makes
people equals? Can we treat people equally without treating them in
precisely the same way? Etc.)

Not only do we have a variety of plausible starting points for our ethi-
cal investigations; we also have a number of obviously poor beginnings for
moral thinking. A morality that celebrates genocide, torture, treachery,
sadism, hostility, and slavery is, depending on how you look at it, either no
morality at all or a deeply failed one. Any morality worth the name will
place some importance on justice, fairness, kindness, and reasonableness.
Just how much importance, and how to balance things in cases of con-
lict—that is where the real philosophy gets done.

Moral Reasoning

In addition to these remarks about appropriate (and inappropriate) start-
ing points for ethical thinking, we should also note that some common
errors can undermine moral reasoning. These errors serve as further evi-
dence that not everything is up for grabs when it comes to ethics.

Moral reasoning, like all reasoning, involves at least two things: a set
of reasons, and a conclusion that these reasons are meant to support. When
you put these two things together, you have what philosophers call an
argument. This isn’t a matter of bickering or angrily exchanging words. An argument is simply any chain of thought in which reasons (philosophers call these premises) are offered in support of a particular conclusion.

Not all arguments are equally good. This is as true in ethics as it is in science, mathematics, or politics. It is easy to mistake one’s way when it comes to ethical thinking. We can land at the wrong conclusion (by endorsing child abuse, for instance). We can also arrive at the right one by means of terrible reasoning. We must do our best to avoid both of these mistakes.

In other words, our moral thinking should have two complementary goals—getting it right, and being able to back up our views with flawless reasoning. We want the truth, both in the starting assumptions we bring to an issue and in the conclusions we eventually arrive at. But we also want to make sure that our views are supported by excellent reasons. And this provides two tests for good moral reasoning: (1) we must avoid false beliefs, and (2) the logic of our moral thinking must be rigorous and error-free.

The first test is pretty easy to understand. Consider the following quote, written in 1833, by the pro-slavery author Richard Colfax:

[T]he mind will be great in proportion to the size and figure of the brain: it is equally reasonable to suppose, that the acknowledged meanness of the negro's intellect, only coincides with the shape of his head; or in other words, that his want of capability to receive a complicated education renders it improper and impolitic, that he should be allowed the privileges of citizenship in an enlightened country.  

And here is William John Grayson, antebellum congressman and senator from South Carolina, on the same subject:

Slavery is the negro system of labor. He is lazy and improvident.... What more can be required of Slavery, in reference to the negro, than has been done? It has made him, from a savage, an orderly and efficient labourer. It supports him in comfort and peace. It restrains his vices. It improves his mind, morals and manners.

There are false beliefs galore in these (and other) defenses of American chattel slavery. Africans, and those of African descent, are not inherently lazy or unfit for a complicated education; they do not have heads with different shapes than whites; head shape is not correlated with intelligence; slavery was anything but comfortable. When one starts with false assumptions, the entire chain of reasoning becomes suspect. Good reasoning, in ethics as elsewhere, must avoid false beliefs if we are to have any confidence in its conclusions.

But it is possible to develop moral arguments that fail, even though every single one of their premises is true. The failure is of the second sort mentioned above: a failure of logic.

Consider this argument:

1. Heroin is a drug.
2. Selling heroin is illegal.
3. Therefore, heroin use is immoral.

This is a moral argument. It is a set of reasons designed to support a moral conclusion. Both of the premises are true. But they do not adequately support the conclusion, since one can accept them while consistently rejecting this conclusion. Perhaps the use of illegal drugs such as heroin really is immoral. But we need a further reason to think so—we would need, for instance, the additional claim that all drug use is immoral, or the separate claim that any illegal activity is also morally wrong.

The argument in its present form is a poor one. But not because it relies on false claims. Rather, the argument’s logical structure is to blame. The logic of an argument is a matter of how its premises are related to its conclusion. In the best arguments, the truth of the premises guarantees the truth of the conclusion. When an argument has this feature, it is logically valid.

The heroin argument is invalid. The truth of its premises does not guarantee the truth of its conclusion—indeed, the conclusion may be false.

Since the best arguments are logically valid, we will want to make sure that our own arguments meet this condition. But how can we do that? How can we tell a valid from an invalid argument, one that is logically perfect from one that is logically shaky?

There is a simple, three-part test:

1. Identify all of an argument’s premises.
2. Imagine that all of them are true (even if you know that some are false).
3. Then ask yourself this question: supposing that all of the premises were true, could the conclusion be false? If yes, the argument is invalid. The premises do not guarantee the conclusion. If no, the argument is valid. The premises offer perfect logical support for the conclusion.

Validity is a matter of how well the premises support the conclusion. To test for this, we must assume that all of an argument's premises are true. We then ask whether the conclusion must therefore be true. If so, the argument is valid. If not, not.

Note that an argument's validity is a matter of the argument's structure. It has nothing to do with the actual truth or falsity of an argument's premises or conclusion. Indeed, valid arguments may contain false premises and false conclusions.

To help clarify the idea, consider the following argument. Suppose you are a bit shaky on your U.S. history, and I am trying to convince you that John Quincy Adams was the ninth president of the United States. I offer you the following line of reasoning:

1. John Quincy Adams was either the eighth or the ninth U.S. president.
2. John Quincy Adams was not the eighth U.S. president.
3. Therefore, John Quincy Adams was the ninth U.S. president.

In one way, this reasoning is impeccable. It is logically flawless. This is a valid argument. If all premises of this argument were true, then the conclusion would have to be true. It is impossible for 1 and 2 to be true and 3 to be false. It passes our test for logical validity with flying colors.

But the argument is still a bad one—not because of any logical error, but because it has a false premise (number 1; Quincy Adams was the sixth U.S. president) and a false conclusion. The truth of an argument's premises is one thing; its logical status is another.

The lesson here is that truth isn't everything; neither is logic. We need both. What we want in philosophy, as in all other areas of inquiry, are arguments that have two features: (1) they are logically watertight (valid), and (2) all of their premises are true. These arguments are known as sound arguments.

Sound arguments are the gold standard of good reasoning. And it's easy to see why. They are logically valid. So if all of their premises are true, their conclusion must be true as well. And by definition, sound arguments contain only true premises. So their conclusions are true. If you can tell that an argument is valid, and also know that each premise is correct, then you can also know that the conclusion is true. That is what we are after.

I started this section by claiming that not all moral arguments are equally good. We're now in a position to see why. Some arguments rely on false premises. Others rely on invalid reasoning. Still others—the worst of the lot—commit both kinds of error.

To reinforce these points, consider one more moral argument. Some people say that killing animals and eating meat is morally okay, because animals kill other animals, and there is nothing immoral about that. Is this a plausible line of reasoning?

Not as it stands. To see this, let's reconstruct the argument by stating it in premise-conclusion form. This is something that I'm going to do for dozens of arguments over the coming pages. For those of you who want to improve your philosophy skills, there's no better way to do so than to take a line of reasoning in ordinary English and try to set it out step by step. That makes it easier to tell just what is being claimed, and so easier to determine the logical structure of the argument and the truth of the premises.

Here is my take on this popular Argument for Meat Eating:

1. It is morally acceptable for nonhuman animals to kill and eat other animals.
2. Therefore, it is morally acceptable for human beings to kill and eat nonhuman animals.

As stated, there is only one premise to this argument. And it is true. So if the argument is problematic, it has to be because of its logic.

And that is indeed its flaw. The argument is invalid; the premise does not adequately support the conclusion. We can assume that the premise is true (indeed, we should accept it), but the conclusion might still be false. The truth of the premise is not enough to guarantee the truth of the conclusion, since what is morally acceptable for animals may not be morally acceptable for us. We would need a further premise, to the effect that we are allowed to do anything that animals do, in order to make this argument valid.

So as it stands, the Argument for Meat Eating is invalid. Therefore it is unsound. Does that mean that its conclusion is false?

No. And here is another important lesson about reasoning: bad arguments may contain true conclusions. After all, even true claims can be
supported by poor reasoning. The fact that the Argument for Meat Eating is invalid does not show that its conclusion is false. It shows only that this particular way of defending that conclusion is no good. For all we know, there might be other, better arguments that can do the trick.

The Argument for Meat Eating, like many other invalid arguments, can be modified so that it takes on a logically perfect form. Indeed, a charitable reading of the argument would show that there is an underlying assumption that, if brought out into the open, would allow us to transform the argument into a valid one. With a little tweaking, for instance, we get the following:

1. If it is morally acceptable for nonhuman animals to kill and eat one another, then it is morally acceptable for humans to kill and eat nonhuman animals. (This is the underlying assumption.)
2. It is morally acceptable for nonhuman animals to kill and eat one another.
3. Therefore, it is morally acceptable for humans to kill and eat nonhuman animals.

And this argument is logically perfect. If premises 1 and 2 are true, then the conclusion, 3, has to be true.

But even this version is unsound. Not because it is invalid, but because it now contains a false premise. Premise 2 is true. But premise 1 is not. Four reasons explain this.

First, animals that eat other animals have no choice in the matter. We do. Second, a carnivore's survival depends on its eating other animals. Ours does not. With rare exceptions, human beings can survive perfectly well without eating animal flesh. There are hundreds of millions of vegetarians leading healthy lives.

Third, none of the animals we routinely eat (chickens, cows, pigs, sheep, ducks, rabbits) are carnivores. They don't eat other animals. So if their behavior is supposed to guide our own, then we should eat only plants.

Fourth, it is implausible to look to animals for moral guidance. Animals are not moral agents—they can't control their behavior through moral reasoning. That explains why they have no moral duties, and why they are immune from moral criticism. But we, obviously, are moral agents, and we can guide our behavior by the moral decisions we make.

Again, this analysis does not prove that the argument's conclusion is false. It just shows that this version of the argument, like the original, is unsound. Meat eating may be perfectly morally acceptable. But this argument fails to show that.

I have spent some time on this argument, not because I want to defend a view about whether vegetarianism is morally required, but because I want to illustrate the possibility of real moral argumentation. We started with a version of the argument that has convinced a lot of people. But when we laid it out clearly, we could see that it was invalid. So we modified it, making an underlying assumption explicit, and doing so in a way that gave us a logically perfect argument. But even this improved version is unsound, because its first premise is false.

Can I be absolutely sure that the premise is false? No. I will be the first to admit that further argument might reveal the error of my thinking. What's more, there is no foolproof method that can perfectly sort true claims from false ones. We may offer excellent reasons and arguments on behalf of our moral views, but at the end of the day, it's possible that not everyone will be convinced.

But this is no different from any other area of inquiry. There is no litmus test that can distinguish all true biological claims from false ones, accurate economic forecasts from the inaccurate, correct chemistry hypotheses from incorrect ones. There is potential for disagreement in all areas of thinking.

The absence of a perfectly reliable test for truth does not mean that all claims are equally true, or that truth is in the eye of the beholder. The earth is not a cube. Six is less than ten. Queen Victoria is dead. Cats are animals. These claims are each true. Their opposites are false. And our say-so has nothing to do with it. These claims would be true even if we were not around to make them. They aren't true because we think they are; we think they are true because they are.

Perhaps things are this way in ethics, too. We will spend a lot of time considering whether that is so, when we discuss metaethics in the last part of the book. For right now, the important thing to note is that we must rely on our good sense and good judgment in all areas of investigation, not just in ethics. The lack of a precision test for truth does not spell the defeat of moral inquiry, since other areas of investigation get along just fine without one.

Moral reasoning is just what its name implies—offering and evaluating reasons that are meant to support moral conclusions. It is not merely a matter of doing a gut check and venting one's feelings. Not every reason is a good one. Some reasons fail to support their conclusions. Others
represent false beliefs. And while it is sometimes hard to separate fact from fiction, this needn't hobble us. Many claims are clearly true, many clearly false. For the others, there is evidence and argument that we can bring in to try to settle the matter. This won't always yield decisive results. But that's the nature of our situation. We can't always be sure of things, in ethics or elsewhere. That shouldn't prevent us from trying to get it right, and backing up our moral views with the best possible reasons.

The Role of Moral Theory

A great deal of philosophy is done at a pretty high level of abstraction. That's not necessarily a bad thing, even though reading and thinking at that level is typically more challenging and less fun than getting engrossed in the details of a well-written novel or historical narrative. Of course we'll need to get back down to earth and familiarize ourselves with the specific facts of a case before knowing what to do in a given situation. But according to most philosophers, knowing what to do here and now also requires that we have a sure grasp of very general moral principles. Knowing which principles are plausible, and how they relate to one another, is a large part of what moral philosophy is all about.

Moral philosophy is primarily a matter of thinking about the attractions of various ethical theories. When we develop and test these theories, we are bound to look beyond the details of specific cases. We are trying to find the deepest truths about our subject matter—how to live. Such truths are wide-ranging and apply to countless cases. That's why moral philosophers so often look beyond the details of specific cases and focus instead on very general principles.

Moral theorizing is the result of a perfectly natural process of thinking. We are questioning beings, interested in seeking out ever deeper explanations of things. And we are uneasy if there is no chance of a unifying explanation, an account that can coherently organize the various aspects of our thinking and experience. This is clear in psychology, for instance, where researchers have always been drawn to unifying views of human motivation. For many psychologists, it all comes down to self-interest (egoists), or to how we have been conditioned (behaviorists), or our sexual impulses (Freudians), etc. This process is evident in physics, too, where the dream is one day to discover the unified theory—a single master principle that will explain all of the workings of the physical world, from the movements of subatomic particles to the behavior of the largest stars and galaxies.

The same desire for unification is also present in ethics. We might begin a conversation by insisting on the immorality of some specific action—say, revealing a patient's confidential information. But someone might challenge our view, and in reply, we would cite a moral rule to back it up: revealing such information is wrong because it betrays a trust. But why is it wrong to betray a trust? Because (we might say) such actions fail to show respect for the person who has been betrayed. But why is it wrong to fail to show respect? And is it always wrong to do such a thing, or are there exceptions? If there are exceptions, what explains them? This is a perfectly natural way of going on. We are searching for increasingly general moral principles with the power to explain more and more cases. The hope is eventually to land on just a single principle, one that will do all of the explaining we need in the moral realm.

Suppose that we think really carefully about our moral beliefs, and find that we ultimately justify them by means of four principles:

- Don't impose unnecessary harm.
- Be nice to others.
- Act justly.
- Tell the truth.

Is there a next step? Of course! Aren't you curious to know whether there is a yet more general rule, one that can explain why these four principles are justified? Like researchers in most areas, moral philosophers remain dissatisfied unless they can offer a truly comprehensive theory that will unify and impose order on our thoughts. Physicists want this. Psychologists want this. So do philosophers.

That's why our focus will mostly be on these very general ethical theories. They represent the natural outgrowth of some extremely compelling ethical ideas—ones that you surely have relied on when trying to justify your own moral views. There is something important in taking our core ethical beliefs and seeing where they lead. They lead to ethical theories; doing moral philosophy is the process of tracing the lines that connect our basic moral views to these more developed theories, and then testing them to see how well they can hold up against our curiosity and critical intelligence.

Looking Ahead

In the pages to come, I present and evaluate a lot of arguments. These are the ones at the very heart of morality, the ones that try to offer answers to
the deepest questions of ethics. As we will see, no fundamental theory—about the good life, our moral duties, or the status of morality—has earned anything like unanimous support among philosophers.

I say this not to dash your hopes, but to give you a realistic take on what to expect. There is a very broad consensus on a number of points in ethics. Consider, for instance, the twelve starting points mentioned earlier in this introduction, a sampling that could easily have been expanded. The moral issues that tend to capture our attention are those that are hotly disputed. What often goes unnoticed is the substantial amount of moral agreement, even across time and place.

Still, when it comes to devising a theory that can offer a comprehensive account of morality, things become much trickier. And then a natural, despairing thought: greater minds than ours have spent lifetimes trying to solve the core questions of ethics, and none of their theories has gained universal support. So what's the use?

It's a fair question. But there is a good answer. We are thinking about how to live; what could be more important than that? We can make a lot of progress in our own thinking by studying the thoughts and arguments of those who have devoted so much effort to this vital task. We may realize that our own "philosophy of life" is marred in ways that we hadn't foreseen. Or we might come to appreciate certain benefits of our views that had escaped our notice. Those of you who work your way through this book will certainly be in a much better position to critically assess your own moral views, and to improve your thinking about how to live your life.

What ethicists across the ages have done is to take a common insight—say, that happiness is the key to a good life, that we must treat everyone fairly, that we must prevent harm—and see how far we can get by consistently applying this insight. Consistency is not to be sneezed at. It's not the hobgoblin of little minds, but a minimum test of a theory's plausibility. Inconsistent, contradictory views cannot be true, which is why philosophers try so hard to avoid them.

Suppose that you are involved in a moral debate, or are thinking about how to improve your own life. If you go deep enough, you'll probably land on a view that you can no longer defend. Perhaps it's one of the twelve mentioned earlier. Perhaps it's something else. Whatever it is, the truth of that view is important. And unsurprisingly, philosophers across the ages will have examined that view very carefully. We can learn from their work. We can find out what is attractive about these starting points. And we can also discover how they might be vulnerable.

That's not everything. Agreed. You won't find, by the end of the book, a recipe for the best life, or a simple step-by-step guide for doing your duty. This book does not belong on the self-help shelves. You probably already figured that out, since such manuals are a lot chattier and far easier to read than this one. But those books never get to the deepest issues—most of them assume, for instance, that happiness is what we should be trying for, or that getting what you want is what life is all about. Philosophers subject such thoughts to intense scrutiny. And it isn't clear whether they survive.

Let's start our work together by having a look at these views, ones that focus on the good life for human beings. There are a lot of surprises in store.

Discussion Questions

1. What are the three main areas of moral philosophy? How might answering questions in one area inform the way we think about the other areas?
2. What is moral skepticism, and what are some reasons that people give for being moral skeptics? Do you think moral skepticism is correct? Why or why not?
3. Do you find the "ethical starting points" presented here to be plausible? Do you think we can prove that such starting points are correct? Do we need to?
4. What are the two ways that a moral argument can fail? Can an argument with either of these failings still have a true conclusion? Why or why not?
5. Is it possible for a valid argument to be unsound? What about for a sound argument to be invalid? For each, either give an example of such an argument or explain why it is impossible.

The Good Life
CHAPTER 1

Hedonism

Its Powerful Appeal

Happiness and Intrinsic Value

If you are like me, and like everyone else I know, you’ve spent a fair bit of time thinking about how your life can go better. You may be doing pretty well already, or may be very badly off, or somewhere in between. But there is always room for improvement.

To know how our lives can be better, we first need to know how they can be good. In other words, we need a standard that will tell us when our lives are going well for us. That standard will help us determine our level of well-being, or welfare.

Many things can improve our well-being: chocolate, sturdy shoes, vaccinations, a reasonable amount of money. These things pave the way to a better life—they help to make it possible, and may, in some cases, even be indispensable to it. Philosophers call such things instrumental goods, things that are valuable because of the good things they bring about.

If there are instrumental goods, then there must also be something worth pursuing for its own sake, whose goodness is self-contained, something valuable in its own right, even if it brings nothing else in its wake. Such things are intrinsically valuable.

A good life is going to contain a lot of what is intrinsically valuable. So what we really need to know is this: what is intrinsically valuable?

We are looking for something whose presence, all by itself, makes us better off. A natural way to start thinking about this is to consider some

clearly good lives, ones that definitely qualify as being good for the people who live them. My top ten wouldn't include those of anyone you'd ever heard of. Instead, I'd pick the lives of certain of my friends and acquaintances, people who are deeply invested in their exciting work, secure in their love for others, physically healthy and active, and possessed of modest but real self-esteem and self-respect. But there is no need to be limited by my choices. Think about your own top candidates, and then ask yourself this question: What makes each of those lives so good? Is there a single feature that each of them shares, something that explains why they are as good as they are? If so, what is it?

The most popular answer is just what you'd expect: happiness. On this view, a good life is a happy life. This means something pretty specific. It means that happiness is necessary for a good life; a life without happiness cannot be a good life. It also means that happiness is sufficient for a good life: When you are happy, your life is going well. The happier you are, the better your life is going for you. And the unhappier you are, the worse off you are.

On this view, there is only a single thing that is intrinsically valuable: happiness. Everything else is valuable only to the extent that it makes us happy. Likewise, there is just one thing that is intrinsically bad: unhappiness. Unhappiness is the only thing that directly reduces our quality of life.

There is a name for this kind of view: hedonism. The term comes from the Greek word ἕδων, which means "pleasure." According to hedonists, a life is good to the extent that it is filled with pleasure and is free of pain.

Before we can assess hedonism, we have to recognize that there are two fundamental kinds of pleasure: physical pleasure and attitudinal pleasure (enjoyment). The first kind is the sort we experience when we taste a delicious fall apple, or when we let the jets from a hot tub dissolve the tension in our backs. These very different kinds of pleasurable feelings usually make us happy, at least for the moment. But such feelings are not the same thing as happiness.

As the hedonist understands it, happiness is attitudinal pleasure: the positive attitude of enjoyment. It can range in intensity from mild contentment to elation. Being happy does not necessarily feel like anything; there is no special sensation or physical quality associated with happiness. I can enjoy a home-team victory or a beautiful painting without experiencing any physical pleasure.

In order to be at all plausible, hedonism must be understood as the view that enjoyment, rather than physical pleasure, is the key to the good life. This may come as a surprise, since we nowadays think of hedonists as those who are always pursuing sensual pleasures. But we must abandon that picture, and fix our sights instead on the view that identifies the good life as one that is full of sustained enjoyment, containing only minimal sadness and misery. That is the hedonist's model of the best life for human beings.

Happiness, understood from now on as enjoyment, is indeed a good candidate for an intrinsic value. It's not like a vaccination or a chocolate bar. If such things generate no benefits—if, say, the vaccination fails to protect you from disease, or if you hate chocolate (I've heard of such strange people)—then there is nothing valuable about them. They are good, when they are, only because of the benefits they bring about. Thus they are only instrumentally good. Happiness isn't like that. It is worth pursuing for its own sake. It is valuable in its own right.

The Attractions of Hedonism

Hedonism can trace its origins in the West to the ancient Greeks. Epicurus (341–270 BCE), the first great hedonist, argued that pleasure was the only thing worth pursuing. Yet he was not calling on us to pursue carnal pleasures. Epicurus argued that the most pleasant condition is one of inner peace. The ideal state of tranquility comes largely from two sources: moderation in all physical matters, and intellectual clarity about what is truly important.

Philosophy is the path to such clarity. Philosophy can reveal the false beliefs that cause so much unhappiness—specifically, as Epicurus saw it, our beliefs that death is bad for us, that the gods are mean-spirited and easily angered, and that sex and money are key ingredients in the good life. Philosophy can help explain the error of such popular ways of thinking, and thereby ease us along the path to happiness.

Skip ahead a couple thousand years, and consider the view of English philosopher John Stuart Mill (1806–1873), perhaps the most famous

---

2. Many who reject hedonism still believe that happiness is the key to a good life. The disagreement is about what happiness really is. Hedonists insist that it is a kind of experience we have—the experience of enjoyment. Others, such as Aristotle, claim that happiness is much more than this; it is, in particular, a combination of enjoyment, intelligence, virtue, and activity. The sort of happiness that we discuss in this chapter and the next is the one hedonists have in mind—namely, enjoyment.
hedonist since Epicurus. Mill's critics claimed that hedonism was a "doctrine of the swine," because it advised us to live like animals, gaining as much brute pleasure as possible. Mill argued that pleasures come in different levels of quality, and that the best pleasures for human beings were those that come only through hard work—especially the work of the mind. Intellectual and artistic pleasures topped his list; physical pleasures were at the bottom. Mill thought that people who have enjoyed both physical and intellectual pursuits always prefer the intellectual pleasures. That was good enough for him, since he also thought that the true test of something's value was the approval of those with knowledge and experience.

As you might expect from a view whose popularity spans thousands of years, there is a great deal to be said on behalf of hedonism. Here are the most important reasons that have won it so many fans.

There Are Many Models of a Good Life
There are a variety of ways to live a good life, and hedonism explains why this is so: there are many paths to happiness. Can woodcutters, professional athletes, or musicians live very good lives? Not according to Plato (427–347 BCE) and Aristotle (384–322 BCE), who thought that philosophical contemplation were essential to a truly good life. Nowadays we are likely to reject such views as narrow-minded and elitist. We think that people from all walks of life have the potential to be well-off. This democratic view about the prospects for the good life fits comfortably with the hedonistic outlook. Because the sources of happiness vary quite widely, and happiness is the key to a good life, there are many ways to live a good life.

Hedonism offers us a kind of flexibility that some of its competitors lack. Many of these competitors identify a kind of activity, such as doing philosophy, as the greatest good. They then say that those who don't pursue it, or who pursue it badly, are unable to lead a good life. Hedonism rejects all such approaches. The best activity for human beings is the one that brings us the greatest happiness. But what makes me happy needn't make you happy. So my recipe for the good life may be very different from yours.

Personal Authority and Well-Being
This diversity of good lives has an interesting implication: hedonists provide each of us with a substantial say in what the good life looks like. And that seems a plus. What makes us happy is largely a matter of personal choice. As a result, we each get plenty of input into what makes our lives go well.

So long as we really do know what will make us happy, hedonism supports the resistance we feel when others try to tell us how to live our lives. And when others counsel us, for our own good, to give up happiness and to pursue a less enjoyable way of life, hedonism assures us that such advice is deeply mistaken.

In one sense, however, hedonism does not allow us to have the final say about what is good for us. If hedonism is true, then happiness improves our lives, whether we think so or not. According to hedonists, those who deny that happiness is the ultimate good are wrong, no matter how sincere their denial. In this way, hedonism follows a middle path between approaches to the good life that dictate a one-size-fits-all model and those that allow each person to decide for herself exactly what is valuable.

Misery Clearly Hampers a Good Life; Happiness Clearly Improves It
Hedonists tell us that misery takes away from a good life, and this is hard to deny. To test this claim, imagine a life full of sadness, with no compensating enjoyments. Surely this life is bad for the person who leads it. It may be good in other respects—the very sad person might, for instance, be a brilliant artist or a mathematical genius. But we are not asking whether the life is good in any way at all. Rather, we are asking about whether the life is going well for the person living it. Specifically, we are asking whether a really miserable person can have a high level of well-being. This is hard to accept, and hedonism explains why that is.

Hedonists also claim that happiness improves one's welfare. To test this, again imagine two people leading identical lives, with only one difference: the first person enjoys his life, and the second doesn't. Surely the first person is better off. If we were to choose between these lives solely on the basis of what would be best for us, we'd select the first, without question. That is precisely what hedonism would recommend.

The Limits of Explanation
The intrinsic value of happiness seems about as self-evident as anything in ethics. And the value of everything else seems easily explained by showing how it leads to happiness.

If hedonism is true, then happiness directly improves one's welfare, and sadness directly undermines it. Just about everyone believes that. Indeed, how could we even argue for something as basic as this? This is where thinking in this area starts. Perhaps no claim about well-being is
more fundamental than the one that insists on the importance of experiencing happiness and avoiding misery.

When we undertake something that is painful or difficult, it makes sense to ask why we'd do such a thing. Suppose, for instance, that you spot me red-faced, huffing and puffing, as I make my way around a track. Why am I willing to suffer so? To get in shape. Why is that important? To be healthy. Why is that important? Because it makes me happy. That's where all such lines of questioning seem to end. If being healthy only made me miserable—not easy to imagine, but possible—then what good would it do me? True, it might make me more attractive, or allow me to live longer, or make me a better athlete. But if those things didn't make me happy, it is hard to see how being healthy would make me better off.

It is perfectly sensible for us to ask about how we'd be better off by studying hard, playing by the rules, dieting, or telling the truth. We can defend the value of such things if we can show that they make us happier. But that shows only that they are instrumental goods. By contrast, we don't need to show that happiness leads to anything else in order to show that it is valuable. We recognize that to be happy is already to be in a desirable state. This supports the hedonist's claim that happiness is intrinsically valuable.

Rules of the Good Life—and Their Exceptions

Hedonism can justify the many rules for living a good life, while at the same time explaining why there are exceptions to these rules.

Almost all of us are better off if we manage to be free of manipulation, crippling illness, enslavement, constant worry, unwanted attention, treachery, and physical brutality. Remove these burdens, and you immediately improve the quality of life. The hedonist's explanation is simple and plausible: in almost every case, eliminating these things reduces our misery.

On the positive side, we can improve our lives by making sure that they contain interesting work and hobbies, trustworthy friends, a giving and understanding sexual partner, and a commitment to causes we strongly believe in. Why? Because such things usually add enjoyment to our lives.

These lists are not complete, and I'm not concerned to argue for any specific item on either one. The lists are meant to reflect common sense. And the point is that hedonism can explain why common sense says what it does. Certain things reliably damage our welfare, because they almost always bring misery in their wake; other things just as reliably improve our quality of life, because they are a source of enjoyment.

Hedonism can also explain why there are exceptions to these rules. Some people enjoy being humiliated or manipulated. For them, we must put these experiences on the positive side of the ledger. Others, such as certain masochists, delight in experiencing various kinds of physical pain. So pain adds to their quality of life, while diminishing it for the rest of us.

Recall that hedonism, as I understand it here, does not say that all pleasure enhances our quality of life—only enjoyment does that. Likewise for physical pain: usually, it lessens our well-being, because we don't enjoy it. But in unusual cases, when a person actually likes it, physical pain can improve that person's welfare.

Hedonism thus explains why it is so hard to come up with universal, iron-clad rules for improving our lives. Such rules hold only for the most part, because increasing our welfare is a matter of becoming happier, and some people find happiness in extremely unusual ways. Hedonism honors both the standard and the uncommon sources of happiness; no matter how you come by it, happiness (and only happiness) directly makes you better off.

Happiness Is What We Want for Our Loved Ones

I have two children, Max and Sophie. I love them very much. I have a very strong desire that they be happy, and an even stronger desire that their lives contain as little misery as possible. This makes perfect sense if hedonism is true.

That's because parents who deeply care for their children want what is best for them. I, like so many other parents, want my children to be happy. That shows that happiness is what is best for them. Right?

Not necessarily. Consider the words of Philippa Foot, a contemporary philosopher who rejects hedonism:

I recall a talk by a doctor who described a patient of his (who had perhaps had a prefrontal lobotomy) as "perfectly happy all day long picking up leaves." This impressed me because I thought, "Well, most of us are not happy all day long doing the things we do," and realized how strange it would be to think that the very kindest of fathers would arrange such an operation for his (perfectly normal) child.3

What Foot is suggesting here is that parents who really care about their children would want things for them other than their happiness. If happiness is of paramount importance, and if a lobotomized person experiences more happiness than the rest of us, then why shouldn't a loving parent sign up her child for such an operation? But the thought is absurd. And the reason, apparently, is that happiness is not the only thing that improves the quality of life. In Foot's example, parents quite reasonably give greater priority to their children's ability to develop their talents, and to pursue worthwhile activities—even those that bring them less happiness.

I think that there is definitely something to Foot's observation. But it is possible to make a common mistake when thinking about it. The error lies in assuming that the following is a surefire test for becoming better off:

(T) If someone knows you very well, loves you, and for your own sake wants you to have X, then X makes you better off.

Most parents know their children very well, love them, and, for their sake, want them to be happy. If (T) is correct, this shows that happiness makes them better off.

But (T) is not correct, because even the dearest friend or parent can be mistaken about what will increase another person's welfare. Consider a father who loves his daughter and wants what is best for her. But he truly believes that a woman's welfare is a matter of how well she serves her husband. Suppose that his daughter has married someone who is physically and emotionally abusive. Such a father might advise his daughter to remain with her abuser, for her own good. Or consider parents whose son has told them that he is gay. They are appalled. They may really love him, and want him, for his own sake, to marry a nice young woman. But marrying a woman is not going to make this man better off. The cares of those who love you are not always a reliable indicator of where your self-interest lies.

Hedonism can explain why this test, (T), fails. If hedonism is true, then there is a different, and perfectly reliable, test of when well-being is improved:

(H) If something makes you happier, then it promotes your well-being; if something fails to make you happier, then it fails to promote your well-being.

The hedonist's test will sometimes conflict with (T). Staying with an abusive husband will not promote a daughter's happiness; marrying a woman will not promote a gay son's happiness. Therefore (H) tells us that such actions will not improve their well-being. And that is correct. (T) gives us the wrong results in these cases. (H) gives us the right ones.

But there is a nagging suspicion that more needs to be said. Although (H) provides the right answers in these cases, it does seem to get things wrong in the specific case that Philippa Foot described. After all, we don't want our children lobotomized, even if they'll be happier as a result! That seems to show that happiness is not the be-all and end-all of a good life. Let's now see whether that's so.

Discussion Questions

1. What is the difference between physical pleasure and attitudinal pleasure? Which kind of pleasure do hedonists claim is always intrinsically valuable? Why do you think that hedonists make this distinction, rather than claiming that all pleasure is intrinsically valuable?

2. In what sense does hedonism “give us a say” in what the good life looks like? Do you think that this is an attractive feature of hedonism? If so, why? If not, why not?

3. Imagine someone who chooses to sacrifice his or her own happiness in order to help others, and claims that this is the best sort of life to live. Would the existence of such a person be a problem for hedonism? Why or why not?

4. What is the point of Foot's comments about lobotomies? How do you think a hedonist might respond to Foot's challenge?

5. Given the arguments of this chapter, do you think hedonism is correct? Why or why not?
Is Happiness All That Matters?

You probably already knew this, but just in case you didn't: no philosophical theory worth its salt is free of difficulties. As a result, you aren't going to get, in this chapter or any of the others, a decisive, knockdown argument for one theory or another. Brilliant minds have developed the theories we consider in this book. And equally brilliant minds have failed to climb on board.

So it should come as no surprise that hedonism, a perennial contender for "Best Theory of Human Welfare," should also have its critics. They have been busy. Here are the major concerns that they have identified.

The Paradox of Hedonism

If something always makes us better off, then it seems reasonable to try very hard to acquire it. With happiness, however, this completely backfires—those who try really hard to make themselves happier almost never succeed. Philosophers call this the paradox of hedonism.

The paradox reminds me of an embarrassing poster I had hanging on my bedroom wall as a child. It showed a butterfly and, not far away, a man sitting in a meadow. The caption read: "Happiness is like a butterfly—the more you pursue it, the more it eludes you. Be still and let it come to you."

We can use this distressing vignette to develop an argument against hedonism. Let's call it the Paradox of Hedonism Argument:

1. If happiness is the only thing that directly makes us better off, then it is rational to single-mindedly pursue it.
2. It isn't rational to do that.
3. Therefore, happiness isn't the only thing that directly makes us better off.

This argument is valid. Its logic is perfect: if both premises are true, then the conclusion must be true. But we also need to know whether both premises really are true. If they are, then hedonism is sunk.

I think the second premise is pretty plausible. The icky sentiment on my childhood poster is correct. Those who seek only happiness, and fixate on acquiring it, are bound to be disappointed. Aiming directly for happiness is not the best way to get it. You'd do far better to seek a partner you love and respect, to develop an exciting hobby, or to find a career you can be proud of. Doing any of these things is a much surer route to happiness.

So the second premise looks good. And the first premise also seems plausible. If happiness is really the only thing that is valuable in its own right, then you should go for it.

But this premise is suspect, precisely because the direct pursuit of good things sometimes prevents us from getting them. Think of the professional golfer in the midst of a slump. She desperately wants to regain her swing. But the more she focuses on this, the harder it becomes. Or consider the immature student who wants more than anything to be well liked, and so tries, way too eagerly and very annoyingly, to be pals with his classmates. Such behavior is self-defeating. He'd be much better off trying less hard.

The bottom line is that even if happiness is our greatest good, it may be irrational to aim for it directly. And if that is so, then premise 1 is false. As a result, the paradox we've just considered, while surprising, does not pose a serious threat to hedonism. It doesn't challenge the idea that happiness is the only thing of intrinsic value. It just tells us that aiming directly for happiness is not a smart way to get it.

Evil Pleasures

Some people take great delight in doing the most awful things. Think of supposed friends who tempt others into addiction, or a powerful boss who
betrays a vulnerable employee. These tawdry people may really be enjoying themselves. But when such enjoyment comes at someone else's expense, it hardly seems a good thing, much less the best thing.

We can build another antihedonist argument around this point. Call it the Argument from Evil Pleasures:

1. If hedonism is true, then happiness that comes from evil deeds is as good as happiness that comes from kind and decent actions.
2. Happiness that comes from evil deeds is not as good as happiness that comes from kind and decent actions.
3. Therefore, hedonism is false.

This argument fails, and it's instructive to see why. There is a confusion contained within it, and it's one that is easy to make.

When we say that happiness that comes from one source is as good as happiness from any other source, we might mean that each is morally equivalent to the other. When we read premise 2 and nod our heads approvingly, this is probably what we have in mind.

But this is not what hedonists have in mind. They don't think that each episode of happiness is as morally good as every other. Rather, they think that the same amount of happiness, no matter its source, is equally beneficial. According to hedonism, happiness gained from evil deeds can improve our lives just as much as happiness that comes from virtue. In this sense, happiness derived from evil deeds is as good as happiness that comes from virtue—each can contribute to our well-being just as much as the other. Hedonists therefore reject premise 2.

And aren't they right to do so? Think about why the happiness of the wicked is so upsetting. Isn't it precisely because happiness benefits them, and we hate to see the wicked prosper? If happiness doesn't make us better off, why is it so awful when the wicked enjoy the harms they cause? And for those who share my vengeful streak: Why is it gratifying to see the wicked suffer? Because misery always cuts into our well-being, and we think it right that the wicked pay for their crimes. Hedonism makes perfect sense of these feelings.

The Two Worlds

Within philosophical circles, one of the most famous objections to hedonism originated with W.D. Ross (1877–1971), a British philosopher whose ethical theory is discussed in chapter 16. Ross invited us to consider two worlds that contain identical amounts of happiness and misery. In one of these, the people are all virtuous; in the other, they are all vicious. Hedonism tells us that these worlds are equally good. No one believes this.

Ross anticipates the hedonist's response: virtuous people are those who reliably make others happy, while vicious people tend to make others miserable. So the situation we are being asked to imagine is impossible. The virtuous world would contain a lot more happiness than the vicious one.

Ross will have none of this. There are nonhuman sources of happiness and misery, such as disease. So imagine, in the virtuous world, that its extra happiness is offset by greater misery resulting from disease. Still, the virtuous world is better than the vicious one.

Ross thinks that this thought experiment allows us to see that virtue is good in its own right, wholly apart from any happiness it brings about. Since hedonism rejects this, hedonism is mistaken.

We can turn Ross's objection into an argument. Call it the Two Worlds Argument:

1. If hedonism is true, then any two situations containing identical amounts of happiness and unhappiness are equally good.
2. Some such situations are not equally good; some are better than others.
3. Therefore, hedonism is false.

I think that Ross is right about premise 2. It is better that virtue, and not vice, be rewarded by happiness. Even if virtue is its own reward, it is better that it be rewarded by happiness as well. And if we have to choose, it is far better that good people be happy than that bad people enjoy themselves. So even if good and bad people are equally enjoying themselves, the situations may not be equally good.

The second premise, then, is actually pretty plausible. But hedonists can reject the first. Their view is not about what makes a situation or a world good, but rather about what makes a life good for the person who lives it. Hedonism, as it stands, doesn't tell us how to determine the value of a world. And so it is not committed to the view that two worlds containing equal amounts of happiness must be equally good.

---

2. When philosophers talk like this, they don't mean that a person is cutthroat and blood-thirsty, but only that he has many vices. In this sense—the one used throughout this book—being vicious is the opposite of being virtuous.
Hedonism does not try to tell us about every way in which things can be good or bad. It tells us only about what directly makes us better off. So long as hedonists do not say that the only value is individual welfare, they can easily allow that such things as biodiversity, beautiful objects, and morally admirable actions add to the overall value of a world. Thus hedonists can (and should) reject the first premise of the Two Worlds Argument.

False Happiness

Imagine a woman who is happy in her marriage, partly because she trusts her husband and believes that he has been completely faithful. Suppose her belief is true. Now imagine another woman who is as happy as the first, and for the same reasons. But in this case, her belief is false—her husband has been cheating on her without her knowledge. It seems that the first woman's life is going better for her. And yet these two women are equally happy.

This story provides us with the basis of an *Argument from False Happiness*:

1. If hedonism is true, then our lives go well to the extent that we are happy.
2. It's not the case that our lives go well to the extent that we are happy; those whose happiness is based on false beliefs have worse lives than those whose happiness is based on true beliefs, even if both lives are equally happy.
3. Therefore, hedonism is false.

This is in one way like the Argument from Evil Pleasures, since both claim that the source of happiness determines how beneficial that happiness is. Critics say that if happiness comes from immoral action, or false belief, then it makes us less well-off than otherwise.

Hedonists deny this. Happiness is happiness, regardless of its source. So hedonists must reject the second premise.

But it is harder to do so here, when it comes to false beliefs. The late Harvard philosopher Robert Nozick tried to show this, in a thought experiment involving an "experience machine." Imagine that there is an amazing virtual reality machine that lets you simulate any experience you like. Suppose you program it for a lifetime of the very best experiences. Once you plug in, you think that you are in the real world, and have no memory of life outside the machine. Your entire life from then on is lived in the machine, and you are as happy as can be, believing yourself to be doing all of the things you truly enjoy.

Compare this with a case in which someone actually does the things and enjoys the experiences that the plugged-in person only dreams of. It seems clear that the second life—the real one—is more desirable. Yet both lives contain the same amount of happiness.

This is meant to show that happiness is not the sole element of well-being. A good life is one that is happy, yes, but not only that. Our happiness must be based in reality. A pleasant life of illusion is less good for you than an equally pleasant life based on real achievement and true beliefs.

The Importance of Autonomy

One of the other things we want from life is to make our own choices about it. We resent it when other people manipulate us, even if they mean well. Sometimes we even prefer the definite prospect of sadness to a more pleasant life that is forced upon us without our consent. In short, we want *autonomy*—the power to guide our life through our own free choices—even if it sometimes costs us our happiness.

Not only do we want autonomy, but we also think that a life without it cannot be fully good. Consider the inhabitants of Aldous Huxley's *Brave New World*. Huxley created a fictional society in which war, poverty, and emotional distress have all disappeared. How have such things been achieved? The rulers have introduced a pacifying drug, called *soma*, which all citizens must take. Books and shows that may upset people have been banned. Close relationships are forbidden, so as to prevent the heartache that comes from the loss of a friendship or a loved one. Better to have loved and lost than never to have loved at all? Not in this society.

The citizens of this brave new world have become complacent animals, obedient to the political masters who are intent on manipulating them. Though this society might well be a happier one than ours, it seems clear that something valuable is missing. That something is autonomy.

We don't need to seek out imaginary tales to appreciate the importance of autonomy to a good life. When we go to the doctor's office, we don't want to be lied to—even if we would be happier were we deceived.
Many dying patients turn down the offer of pain medication, because it can interfere with their ability to make rational decisions. Such patients prefer to face their end in a clear-eyed way, even if it means that they are more miserable as a result.

Autonomous choices don’t always lead to happiness. Things go wrong. We make free choices that lead to damaged relationships, financial disaster, missed opportunities. Still, we need only imagine a life without autonomy to see what a tragedy it would be. Read the reports of Soviet psychiatrists who systematically drugged and tortured critics of the regime. Many of these critics went insane; others were reduced to bowing and scraping before their white-coated masters.

These doctors caused appalling unhappiness. But that is not the only harm they did to their victims, and in some cases it is not the worst of the damage done. Even if drugs had kept the dissidents happy, the actions of these doctors would still have been a horrendous crime, because of the way in which they tried to crush the independence of their victims.

A searing picture of how the loss of autonomy undermines well-being can be found at the conclusion of Ken Kesey’s *One Flew over the Cuckoo’s Nest*. Its hero, R. P. McMurphy, is a free spirit with contempt for rules and for the authorities who enforce them. McMurphy is committed to a mental institution and slowly broken, eventually being forced to submit to a lobotomy that leaves him an empty shell. (Recall Foot’s anecdote of the previous chapter.) That this is all supposedly done for his own good only makes the tragedy greater. At the end, he may be happier, having at this point only a childlike capacity to understand the world. But it hardly seems that he is better off as a result. And the explanation is simple: preserving our autonomy is vitally important, even if it doesn’t always make us happier.

It’s a good thing to be able to exercise autonomous choice, and this explains what is objectionable about paternalism—someone’s limiting your liberty against your will, but for your own good. A society of arranged marriages, forced career choices, antigambling legislation, and motorcycle helmet laws might lead to greater happiness. In some cases, these restrictions might really be justified. And yet even so, there is something to regret. We lose the opportunity to take chances, to risk our happiness, to exercise real freedom. Manipulation and paternalism, even when done in a way that gains us happiness, are still objectionable to some extent. And that is because they sacrifice something of intrinsic value: autonomy. Happiness is not the only thing that is important in its own right. Autonomy is, too.

Here we have the makings of another argument against hedonism. Call this the Argument from Autonomy:

1. If hedonism is true, then autonomy contributes to a good life only insofar as it makes us happy.
2. Autonomy sometimes directly contributes to a good life, even when it fails to make us happy.
3. Therefore, hedonism is false.

The first premise is clearly true. The central claim of hedonism is that happiness is the only thing, in itself, that makes us better off. All other things (e.g., autonomy, virtue, true knowledge) improve our lives only to the extent that they make us happier.

So everything hinges on the second premise. It seems plausible. When we consider the lives of those who have been deprived of their autonomy, we see the absence of a great value, something that, by itself, appears to make a life a better one. Given a choice between drug-induced contentment and plotting our own risky course through life, we prefer the latter path. We want our lives to be authentic, to reflect our own values, rather than those imposed on us from the outside—even if we are not always happier as a result. Hedonism cannot account for that.

**Life’s Trajectory**

If hedonism is true, then those whose lives contain the same amount of happiness and unhappiness must be equally well-off. But this seems false. Consider the sad case of Delmore Schwartz, a brilliant writer and conversationalist, who served as the basis of the title character in Saul Bellow’s novel *Humboldt’s Gift*. Schwartz earned many awards early in his career, and taught at Princeton and Harvard for several years. But his last decade was spent in increasing frustration and isolation. Addicted to alcohol and drugs, and experiencing increasingly severe paranoia and mental illness, he died alone in a seedy hotel in Times Square, the promise of his early years left unfulfilled.

It is impossible to say just how much happiness and sadness filled Schwartz’s life. But imagine a person whose early life was all heartache
and hardship—Jane Eyre or Oliver Twist, for instance, or, from real life, perhaps someone like Mary Karr, whose terrific memoir, The Liars’ Club, portrays a childhood about as miserable as can be. In such lives, the suffering eventually yields to happiness, and many years of satisfaction and pleasure.

When we compare lives with such different trajectories, it is hard to resist the thought that a life that begins badly but continually improves is better than a life that starts out with a bang and goes slowly, steadily downhill—even if there is no difference in the total amounts of happiness contained in each life. We can fashion this thought into the Trajectory Argument:

1. If hedonism is true, then the overall quality of a life depends entirely on the amount of happiness and unhappiness it contains.
2. The overall quality of life depends on at least one other factor: whether one’s life reflects an “upward” or “downward” trajectory.
3. Therefore, hedonism is false.

To make this criticism stick, we need to be sure that we are not sneaking in extra happiness on the part of the fortunate person whose life ends better than it began. The total happiness and unhappiness within the lives being compared must be the same. The only difference must be in the timing of the happiness and misery. If we take care to respect this requirement, I think we still feel that equal amounts of happiness and misery may not yield lives of equal well-being.

When is it rational to feel miserable about how your life is going? Simple: when something really bad happens to you. On the face of it, this can include a huge number of things—losing a leg in a car accident, being jilted by someone you love, missing the opportunity of a lifetime, etc. Each of these rightly causes great sadness. If hedonism is correct, however, this short list, and the much longer one we could undoubtedly put together, are basically mistaken, for there is only one truly bad thing that can happen to you, and that is to experience sadness. Things can harm you only if they cause you to be unhappy.

If hedonism is true, then as long as we remain alive and greet each day happily, our lives cannot go badly. A stiff upper lip—or a soma pill, or genuine indifference—is enough to protect against harm.

So, for those who want to be immune from harm, here is the recipe. They must become either emotionally blank or permanently upbeat. Those who are never sad are never harmed. Their talents might go to waste; their limbs might atrophy; their senses deaden, friendships break, curiosity dim—if hedonism is correct, none of this will undermine their well-being, so long as they are not saddened by it.

Perhaps unhappiness always makes us worse off. But other things might do so as well. Consider how reasonable it is to be saddened, say, at a failed chance at love, or at the death of a dear friend. Such things diminish our happiness. But they do so only because our happiness, in these and so many other cases, depends on our appreciating what has value in its own right. If loving relationships didn’t by themselves make us better off, it wouldn’t be so clear that their loss is our loss. We mourn because we have been deprived of someone whose presence has directly made our lives richer.

Hedonism runs into trouble when trying to account for this. Here is an argument that shows how. Call it the Argument from Multiple Harms:

1. If hedonism is true, then you can be harmed by something only because it saddens you.
2. You can be harmed in other ways.
3. Therefore, hedonism is false.

The first premise is clearly true. And the second also seems plausible. Tragedies don’t disappear just because their victims are reconciled to
them. The unhappiness we experience is bad for us. But it can also be a *symptom* of the loss of something that, all by itself, matters to our well-being. Our misery in such situations is evidence that things other than happiness can directly make a difference to our well-being. If that is so, then hedonism is mistaken.

**Conclusion**

Hedonism has always had its fans. And, as we have seen, there are many good reasons for its popularity. It explains why there are many paths to a good life. It strikes a balance between a view that imposes just one blueprint of a good life, and a view that allows anything to be valuable so long as you think it is. It provides a ready explanation for why misery so clearly damages a life, and why happiness so clearly improves it. Hedonism offers a natural stopping point for explaining what is intrinsically valuable. It accounts for why the rules of a good life allow for exceptions. And happiness is what we want for our loved ones—what better evidence that happiness truly contributes to a good life?

And yet hedonism is not problem-free. I think that hedonists have good replies to the paradox of hedonism, the worry about evil pleasures, and Ross's Two Worlds objections. But things become trickier when we consider the value of a happiness that is based on false beliefs. Further, hedonists cannot allow for the intrinsic value of autonomy. They can't make sense of the idea that, of two lives containing the same amount of happiness, the one that continually shows improvement is better than the one that has gone steadily downhill. Hedonists also fail to appreciate that unhappiness is often a symptom that something intrinsically valuable—something other than happiness—has been lost.

Perhaps happiness is not, after all, the key to our well-being. Let's now consider an alternative approach—one that tells us that getting what you want is the measure of a good life.

**Discussion Questions**

1. What is the paradox of hedonism? Do you think the paradox gives us good reason to reject hedonism? Why or why not?
2. If you had a chance to get into the “experience machine” for the rest of your life, would you do it? Why might the idea of the experience machine pose a challenge for hedonism?

3. What is autonomy? Can hedonism can account for the value of autonomy? Defend your answer.
4. What does it mean to talk about the “shape of a life”? Are some lives better than others simply in virtue of their “shape”?
5. Of all of the objections to hedonism presented here, which do you think is the strongest? Do you think that the hedonist has a convincing reply? Why or why not?
Getting What You Want

Suppose that you’re unsure about what it takes to live a good life. So you visit your nearest philosophy department, plunk yourself down in the ethicist’s office, and ask her directly. And suppose she gives you the following advice:

1. Love the one you’re with.
2. Get in shape.
3. Dance.
4. Study philosophy.
5. Build things.

That strikes me as a pretty good list. It’s not the whole of a good life, agreed, but it’s not a bad start.

But what if you disagree? What if you’re a terrible dancer? What if you don’t care about the benefits of getting in shape? Maybe you’re a klutz, like me, and can’t build anything more complicated than a paper airplane.

Come to think of it, what could possibly qualify this professor to give advice about the good life? Surely, you might think, you get to decide for yourself what’s going to make your life better off. Dancing and building things may work wonders for her, but that doesn’t mean that her recipe for success has any universal authority. No recipe does.

It all depends on what you care about.

The desire satisfaction theory of human welfare takes this sort of criticism very seriously. The theory tells us that your life goes well for you to the extent that you get what you want. Something is good for you if it satisfies your desires, only if it satisfies your desires, and because it satisfies your desires. At the other end of the spectrum, your life goes badly just when your desires are frustrated.

On this view, nothing can make your life better unless it gets you what you want. Such things as wealth, health, and a loving family are personally beneficial only if we want them, or the things they can provide. If we don’t care about them, then they can’t make us better off.

There is a lot to like about this theory. Here are some of its main attractions.

A Variety of Good Lives

The desire satisfaction theory explains why there are many models of a good life, rather than just a single one. What makes my life good may be very different from what does the trick for you, because you and I may not want the same things. Our deepest desires determine what counts as life’s improvements or failures. On this line of thinking, nothing—not health, love, knowledge, or virtue—is an essential ingredient in making everyone’s life better off. Whether our lives have been improved depends entirely on whether our desires have been fulfilled.

It seems possible to have a good life that consists in wholehearted devotion to religious causes, to philosophy, music, travel, social justice, Star Trek conventions, or a favorite sports team. A good life focused on none of these, or a combination of these, also seems possible.

This makes perfect sense if we assume that our individual desires hold the key to a good life. I prefer chocolate to vanilla, and you don’t? Then chocolate makes me better off, and vanilla does the same for you. You really, really want to collect igneous rocks? Splendid. Then you’d better get your hands on some. But my life will go perfectly well without any. The desire satisfaction theory easily accounts for this: your life goes well to the extent that your desires are satisfied. Since people desire very different things, there is a wide variety of good lives.

Personal Authority

Against the previous point, many people would argue that the good life must be focused on a single kind of pursuit—religious devotion, inner harmony, creativity, philosophy, to name just a few prominent candidates. But there is something worrying about such single-mindedness. For each
of these candidates, there are many who feel excluded and even angered at the suggestion that their life doesn't fit the favored model. After all, if you love excitement and hate tranquility, can it really be that inner harmony is the key to your well-being?

Have you ever had this experience? Some well-dressed folks come knocking at your door and end up telling you that you are wasting your life. You've strayed too far from their model of ideal living. It's easy to feel that they are being presumptuous. They have a one-size-fits-all framework of the good life, and you don't get any input in forming the plans.

Desire theorists reject all such views. If the desire theory is right, then each of us has the final say on what makes our life go well, because it's our own desires that determine how well we are faring. Further, no one gets to dictate which basic desires we should have. That is a personal matter. There is no universal standard for appropriate desires; to each his own. This view gives us a huge amount of freedom to choose our own vision of the good life. The only limitation here is that the good life must consist of satisfied desires. But what these desires are for—that is entirely up to you.

Avoiding Objective Values

A popular approach says that the good life consists of a handful of activities and experiences: gaining knowledge, experiencing love, appreciating art and music, being virtuous, and taking enjoyment in all of these things. This is an example of an objective theory of human welfare. It is objective in the sense that what directly contributes to a good life is fixed independently of your desires and your opinions about what is important.

There are lots of objective theories of welfare. Some theories, for instance, insist that the more knowledge you have, the better your life is going for you—even if you don't care very much about obtaining knowledge. (I'm skeptical of such a view: is your life really better now that you know I have a cat named Oscar?) Other theories insist that virtue is required for a good life, no matter how you feel about virtue's importance. Hedonists claim that happiness is intrinsically valuable—even if, very unusually, you don't care about being happy.

Desire theorists reject all objective theories of welfare. In doing so, they spare themselves the huge controversies that surround the defense of objective values. It is really difficult to argue for such values. That's because, for any contender, we can always ask a simple question: how can something make my life better if I don't want it, and don't want what it can get me? Sure, if you want to be a star athlete or a world-class musician, then daily practice will improve your life. But if you have no such dreams, and don't care about anything that such practice can get you, then how could it be good for you? That's a very hard question. Desire theorists never have to answer it.

Motivation

Many people think that something can be good for us only if we can be motivated to pursue it. This thought is what underlies many of the suspicions about objective theories. Some people are left completely cold when they imagine (say) a life of wealth or power. We suspect that if this is true, then such things really don't make them better off. These doubts can be expressed in the First Motivation Argument:

1. If X is truly good for you, then you will be motivated to get X—so long as you know about X and know how to get it.
2. Many people who know about wealth and know how to get it aren't motivated to become wealthy.
3. Therefore, wealth will not improve the lives of such people.

We can repeat this argument for anything that is said to be an objective good—virtue, religious observance, fame, health, and so on. Regardless of which good you put forward (i.e., no matter how you fill in the blank in the argument above), there will always be some intelligent people who don't care about it. The upshot is that this argument threatens all objective theories of well-being.

Objective theories of well-being have a really hard time explaining the connection between what's good for us and our motivations. On the desire theory, explaining this is a piece of cake. To see this, consider the Second Motivational Argument:

1. If something is truly good for you, then it will satisfy your desires.
2. If something will satisfy your desires, then you will be motivated (at least to some extent) to get it—so long as you know what you want and know how to get it.
3. Therefore, if something is truly good for you, then you will be motivated (at least to some extent) to get it—so long as you know what you want and know how to get it.
The first premise states a central claim of the desire theory. The second premise seems clearly true, once we understand that desires motivate us to do things. And the argument is valid, so if both premises are true, then the conclusion must be true. Indeed, desire theorists regard this conclusion as an important truth, and think that it is a major strike against objective theories that they cannot allow for it.

Justifying the Pursuit of Self-Interest

What is the point of trying to improve your life? Many regard this as a rhetorical question. Desire theorists don’t. They have an answer. I think that there is always some reason to do what is best for yourself. Almost everyone thinks so. But what if someone challenged this claim? Is there anything that we can say on its behalf?

Desire theorists have something to say. And this is a big plus, since it is always best to be able to justify a claim, rather than have to insist on its truth without being able to back it up. The desire theorist can offer the following argument to support the view that there is always good reason to look out for ourselves. Let’s call this the Argument for Self-Interest:

1. If something makes us better off, then it satisfies our desires.
2. If something satisfies our desires, then we have reason to obtain it.
3. Therefore, if something makes us better off, then we have reason to obtain it.

Premise 1 states an essential claim of the desire theory. And premise 2 seems pretty plausible. Our wanting something gives us a reason to get it. If you want to lose weight, then you have reason to exercise and watch your calories. If you want to ace that exam, you have reason to study hard. If you want to complete your collection of Romanian postage stamps, then it’s a good idea to track down the missing ones and buy them.

In short, if there is always reason to get what you want, and if (as the desire theory says) getting what you want always makes you better off, then there is always reason to make yourself better off.

Contrast this with an objectivist theory of well-being. Suppose, for instance, that an objectivist claims that inner peace is good for you, whether you know it or not. But suppose that inner peace is not your cup of tea. You embrace risk, you hate to be bored, and you enjoy a life of turmoil and excitement. If you don’t care about inner peace, and it gets you nothing you do care about, then it is hard to see why there is any reason for you to seek it. The same goes for any other supposed objective good.

Desire theorists easily handle this problem. If they are right, you have reason to promote your self-interest because you have reason to get what you want, and getting what you want is the key to self-interest.

Knowledge of the Good

If the desire theory is correct, then we have a straightforward answer to one of life’s eternal questions: how can I know what is good for me? The answer is simple: be clear about what you want. Then make sure you know how to get it.

This isn’t always easy in practice. I may really want to get someone to fall in love with me, but finding the best method to do this could be (to put it mildly) quite tricky.

Difficulties can also arise if I want conflicting things—and don’t we all? In such cases, you should fulfill the desire that you care about more. Again, it isn’t always easy in practice to tell which one this is. Sometimes we realize only too late that we made a mistake and pursued a goal that mattered less to us than the one we passed up. In that case, we chose badly—we may have gained some good, but we would have gained even more had we satisfied our deeper desire.

These are not difficulties with the desire theory. After all, at times it really is very hard to know how to make our lives better. A plausible theory of well-being should explain why we are puzzled, when we are. It should also give us clear advice in many cases. The desire theory does both. It tells us why it is sometimes so difficult to know what is best for us—because we don’t know how to get what we want, or we aren’t sure about what we want most. And it also explains the easy cases—these are precisely those where we do know what we want, and know how to get it.

Compare this picture to the one offered by objectivists. If personal opinion or preference does not determine what is best for us, then how can we know what to aim for? Objectivists insist that (say) knowledge, virtue, and inner peace are directly good for us. But how can they defend such claims, if we consistently deny them? What if—as is really the case—different objectivists disagree among themselves about what has intrinsic value? Are we just supposed to “intuit” the truth here? What happens if I intuit the importance of virtue and you don’t? How do we resolve the
dispute between those who are sure that virtue is the key to a good life and those who insist that fame and fortune is what it's all about?

Desire theorists avoid all such difficult questions. They deny that there are any objective goods. Thus they are spared the task of explaining how we could have knowledge of such things. You want to know how to make yourself better off? Get clear about what you really care about. Then find out how to get it. It isn't always easy. But it isn't a fundamental mystery, either.

Discussion Questions

1. Many people find the desire theory attractive on the grounds that it leaves what counts as a good life “up to us.” To what extent are our desires “up to us”? Can we really choose whether we want something or not?
2. What is an objective theory of human welfare, and why isn't the desire theory an objective theory? Is the denial of objective values an attractive or an unattractive feature of the desire theory?
3. Why is it difficult for objective theories to explain the connection between well-being and motivation? How does the desire theory solve this problem?
4. According to the Argument for Self-Interest, we always have reason to pursue what we want. Does this assumption seem true to you? Can you think of any counterexamples?
5. Look back at the objections to hedonism presented in chapter 2. Does the desire theory do a good job on handling all of the concerns raised there? Defend your answer.

Problems for the Desire Theory

The previous chapter offers a very nice laundry list of attractions of the desire satisfaction theory. These attractions help to explain why it is so popular. But (you guessed it) there are also a number of difficulties that this theory faces, and some of them are serious enough to force us to revise the view, and possibly even to reject it.

To appreciate these worries, let's remind ourselves of the two central claims of the desire theory:

(A) If something is good for us, then it fulfills our desires.
(B) If something fulfills our desires, then it is good for us.

(A) tells us that something must satisfy our desires in order to be good for us; desire satisfaction is necessary for becoming better off. (B) tells us that satisfying our desires is enough to make us better off; desire satisfaction is sufficient for becoming better off. Let's begin by considering (A), and then move to a discussion of (B).

Getting What You Want May Not Be Necessary for Promoting Your Good

We can test (A) by seeing whether we can come up with an example in which something benefits us, even though it doesn't satisfy any of our desires. If there are any such examples, then (A) is false.

There do seem to be such examples. Three spring to mind.
The first is that of pleasant surprises. These are cases in which you are getting a benefit that you didn't want or hope for. Imagine something that never appeared on your radar screen—say, a windfall tax rebate, an unexpectedly kind remark, or the flattering interest of a charming stranger. It makes sense to say that you're a bit better off as a result of such things, even though they didn't satisfy any of your desires. Of course, now that you've experienced such things, you may well want more of them. But that's because they have made your life better already. And they did that without answering to any of your preexisting desires.

The second case is that of small children and the severely mentally handicapped. We can benefit such people in a number of ways, even though we don't give them what they want. A parent benefits her three-year-old by getting him vaccinated against various diseases, even though the child doesn't want the shots, and doesn't know enough to want to be free of the diseases that he is being immunized for. A psychologist can benefit a mentally unstable patient with a treatment that may be the last thing she wants. We are sometimes able to improve the well-being of such people, even though we don't give them what they want.

The third case is that of suicide prevention. Those who are deeply sad or depressed may decide that they would be better off dead. They are often wrong about that. Suppose we prevent them from doing away with themselves. This may only frustrate their deepest wishes. And yet they may be better off as a result. (We will return to this example later.)

In each of these cases, we can improve the lives of people without getting them what they want. They may, later on, approve of our actions, and be pleased that we acted as we did. But this after-the-fact approval is something very different from desire satisfaction. Indeed, it seems that the later approval is evidence that we benefited them, even though we did not do anything that served their desires at the time. And that is evidence that (A) is mistaken.

**Getting What You Want May Not Be Sufficient for Promoting Your Good**

If (B) is true, then we are better off whenever our desires are satisfied. There are many reasons to doubt this.

**Desires Based on False Beliefs**

Sometimes we want something for its own sake, but our desire is based on a false belief. When we make mistakes like this, it is hard to see that getting what we want really improves our lives. Suppose you want to hurt someone for having insulted you, when he did no such thing. You aren't any better off if you mistreat the poor guy. Or perhaps you desperately want to be popular with a certain group of people, but only because you think that they are glamorous and happy. Once you get to know them better, you come to realize how shallow and miserable they are. As the old saying goes: beware of what you wish for—it may come true.

From now on, then, we should understand the desire theory to insist that it is only informed desires whose satisfaction will improve our lives. Fulfilling desires based on false beliefs may not improve our welfare. So the real thesis under consideration will be

(C) If something fulfills our informed desires (i.e., those not based on false beliefs), then that thing is good for us.

**Disinterested and Other-Regarding Desires**

All of us want some things that seem entirely unrelated to us. Our desires are directed, say, at the interests of strangers, or at no interests at all. (Perhaps I want there to be an even number of planets, and now that Pluto has been banned from the club, I've finally gotten my wish.) In such cases, we can get what we want, even though it is hard to see how our lives are improved as a result.

In the fall of 2004, I watched in disbelief as the Boston Red Sox defeated the New York Yankees to clinch the pennant. The Red Sox then defeated the St. Louis Cardinals to win their first World Series championship in eighty-six years. I didn't grow up in Boston, and hadn't cared about baseball since I was a kid. But I became hooked by this classic underdog story, and found myself wanting the Red Sox to win. They did. But I can't see that my life was any better for it.

A few years ago I read about a whale that had beached itself on a New England coast. I remember wanting that whale to survive, to be eased back into the ocean without being harmed. And it was. It's easy to see that the whale was better off as a result of the rescue operation. But it's not so easy to see that my life got any better.

There is a natural reply to such examples. My life was indeed mildly improved, because I was pleased to get what I wanted. And that may be true. The problem with this reply, however, is that it is not available to desire theorists. That's because the desire theory does not assign any intrinsic value to pleasure. If desire theorists are correct, then your life goes better just so long
as more of your desires are satisfied—regardless of how much pleasure this
yields. A more pleasant life is not necessarily better for those who live it.
There is a quite different reply we might make on behalf of the theory.
We might amend (C) to read:

(D) If something has fulfilled our informed, self-regarding desires,
then that thing is good for us.

Self-regarding desires are those that concern only yourself. Since my desire
for an even number of planets, a Red Sox victory, and the whale's rescue
were not self-regarding, then they cannot serve as counterexamples to (D).

Disappointment
Suppose that you form a self-regarding desire that isn't based on any false
beliefs. And you get what you want. If (D) is true, this guarantees some
improvement in your life.

But consider a young musician who has staked his hopes on becom­
ing famous some day. And that day comes—but all he feels is disappoint­
ment. He got what he wanted. He knows it. And he hates how it feels.

Getting what you really want can sometimes be a huge letdown. All
that buildup, and then, rather than any feeling of joy, just a blank sort of
sadness—or worse. You've invested yourself in some project, have brought
it to a successful end, and then find yourself filled with emptiness, bore­
dom, or depression.

I was recently reminded of these points when reading the following
passage in John McEnroe's autobiography:

> I was playing great tennis, and I destroyed [Ivan] Lendl to win the '84
> Masters. . . . I'd finally taken my game to what felt like a notch above all
> my opponents. It should have been great. I wish it had been. But it
> wasn't.

It still felt hollow—I'd thought it would help straighten me out . . .
but it wasn't doing a thing for me inside. It reminded me of the
story of King Midas: My success wasn't translating into happiness.¹

If seeing your desires come true only makes you miserable, then how
could this mark an improvement in your life? (D) commits us to saying
that you are better off in such a case. This is very difficult to accept.

¹. John McEnroe with James Kaplan, You Cannot Be Serious (New York: Berkeley Books,

We could, of course, modify the desire theory once again:

(E) If something has fulfilled our informed, self-regarding desires, and
we are pleased as a result of this, then that thing is good for us.

(E) might be true. But that should be small comfort to the desire theorist,
for it now seems that it is pleasure that is making our lives better off, rather
than desire satisfaction per se. That of course is something that hedonists
will defend, but it's bad news for desire satisfaction theorists. After all, if
getting what you want only makes you miserable, it is hard to see how you
are any better off as a result.

Ignorance of Desire Satisfaction
Consider a case in which my informed, self-regarding desires are satisfied.
I get what I'd hoped for. But I don't realize this. I never know that my goal
has been met. It doesn't seem that I am any better off in such a situation.

Imagine a person deeply committed to finding a cure for a terrible
disease. After years of hard work, she succeeds. But she goes to her grave
never realizing this. She thinks her efforts have been wasted. Her success
does not, by itself, mark any improvement in her life.

Or think of a man who very much wants to be a father. He has a series
of relationships, one of which leads to a pregnancy and then to a child. But
the mother never informs him of this, and he never finds out through other
channels. His desire is satisfied, but his quality of life has not improved.

As in the cases of disappointment, what we have here are examples in
which our informed, self-regarding desires are satisfied, but we don't seem
to be any better off as a result. That spells trouble for the desire satisfaction
theory.

Impoverished Desires
According to the desire theory, in any of its versions, having a good life is
essentially a matter of fulfilling your desires. Our desires, however, are
often shaped by the way we have been raised. The expectations that we
have been taught to have are especially important influences. And this cre­
ates a problem.

Some parents have raised their children to believe themselves unwor­
thly of love, or incapable of real accomplishment. Some societies continue
to treat the women among them as second-class citizens (if citizens at all).
Women in such societies are told from the earliest age that any political or
professional hopes are unnatural and beyond their reach.
It's easy to take such messages to heart. If you are told from the cradle that your greatest ambition should be to serve your master, then you may well end up with no desire any stronger than that. If desire fulfillment is the measure of a good life, then such lives can be very good indeed.

That doesn't seem right. For instance, it is tempting to think that a slave cannot live a very good life, regardless of whether her desires are fulfilled. And that is because she is unfree. But desire theorists reject the idea that there is anything intrinsically valuable about freedom. Nothing is important in its own right—not intellectual or artistic achievement, not freedom, not pleasure—unless one desires it. If it has been drilled into your head that it is foolish to seek freedom, or that education is unnecessary for "your kind," then a reasonable response may well be to abandon hope for any such things. Better to have goals you can achieve than to set yourself up for constant disappointment.

And yet what kind of life is that? The desire theorist seems forced to say that it may be among the best. The lower your expectations, the easier they are to satisfy. As a result, those who set their sights very low may have a greater number of satisfied desires than those with more challenging goals. But this hardly seems to make for a better life.

The Paradox of Self-Harm and Self-Sacrifice
If the desire theory is correct, then getting what you want makes you better off. But what if people want to harm themselves? This needn't be irrational. For instance, people may feel remorse for wrongs they have done, and want to do penance. Others may despise themselves, full of self-loathing, convinced that they deserve only harm, rather than good. No matter their ultimate motive, they deeply want to harm themselves.

In other cases, people want to sacrifice their self-interest in order to promote the good of someone they care about, or some cause that is more important to them than their own welfare.

It seems possible for such people to succeed. People can willingly harm themselves, and they can sacrifice their well-being to causes that matter to them. But the desire theory denies this: if such people satisfy their self-destructive or self-sacrificing desires, then the theory says that they are better off! So long as they get what they really want, then they must be benefited as a result. And yet their fondest wish is to harm or to sacrifice themselves. So the desire theory generates a paradox: wanting to harm or sacrifice yourself makes it impossible to do so. Since it does seem possible both to want such things and to succeed, the desire theory is suspect.

The Fallibility of Our Deepest Desires
Most of us don't intentionally set out to harm ourselves. But there are other cases in the neighborhood that pose problems for the desire theorist. I am thinking here of suicide, where the would-be suicide is regarding her death not as a harm, but rather as a benefit. She is not trying to make herself worse off. Rather, she is trying to improve her life—by ending it. True, this also has an air of paradox about it. Let's see what a desire theorist can say about such cases.

There are many different kinds of suicides. The one that poses the sharpest problem for the desire theory is that of a person whose life, by our lights, has terrific promise and is definitely worth living. Yet the suicidal person does not share our view. Suppose, in a common example, that a young man's lover has broken up with him and left, never to return. He is stricken with grief and decides to kill himself. This becomes his obsession; he most wants to die. If the desire theory is true, then the deeper the desire, the better off its fulfillment will make you. Thus in his case, dying is his best option. Nothing else will make him as well off.

It is hard to accept that. And desire theorists may have an out. After all, their best view is that the satisfaction of informed desires is what contributes to your well-being. And the suicide's desire to end his life might be based on a false belief. But which belief would this be? He may be well aware of all of the facts of his life, and look at them with only pain and anxiety. In that case, it is tempting to think that his false belief is this: my life is going very badly, and isn't likely to get any better.

The problem is that desire theorists may have to regard this belief as true. On their view, your desires determine how well your life is going. If this person is clear-eyed, and sees that he is getting very little of what he wants, then his life really is going poorly. Further, he may be quite self-aware about what he is likely to want in the future—a relationship with his former lover—and realize that this desire is bound to be frustrated. If so, then his life is not going to improve.

What we want to tell such a person is this: change your desires! Stop wanting her so much. (Not that this is easy. Not that it can happen overnight.) But suppose that he won't, and that he knows this. We tell him to change his desires, because his current obsession is only causing him misery and preventing him from taking an interest in what really matters. Yet from the desire theorist's perspective, such advice is fundamentally mistaken. Things matter only to the extent that you care about them. So happiness is important only so long as we want it. What really matters depends
entirely on our desires. If, at bottom, you really want to die, then you are better off dead.

This is one of many possible examples of basic desires that can appear to be fundamentally off base. Consider the following cases, offered by philosopher Joel Feinberg. The first is that of an exhibitionist who exposes himself in public, not to solicit or threaten others, but just because he wants, as Feinberg puts it, "exposure for exposure's sake." Or a kleptomaniac—in Feinberg's example, a high school student, who was otherwise as normal as you or I, but who was caught in possession of twenty-one shirt buttons, seven pairs of clippers, nine bike wrenches, five pocket mirrors and a variety of oil cans, violin strings, and combs. He didn't intend to use these things for any purpose at all. He just wanted them in their own right. Feinberg's last example invites us to consider "a well-off man who shoplifts only one kind of item, women's brassieres. He could easily afford to pay for these items. . . . He does not enjoy stealing them and suffers great anxiety in worrying about being found out. . . . If you ask him for an explanation of his bizarre conduct, he will confess himself as puzzled by it as any observer."

Such cases allow us to see how one of the main attractions of the desire theory—its reluctance to criticize our desires, to hold them up to any objective standard of value—is also a weakness. It isn't that hard to satisfy these unusual desires. So if the desire theory is correct, the good life is easily within the grasp of such people. But the thought that any of them is living a good life is very hard to accept.

Conclusion

There are a number of reasons to think that the good life consists in our getting what we want. But there are some serious problems with this suggestion, and with each of its variants. Most of the problems boil down to this: the desire theorist cannot recognize that any desires are intrinsically better than any others. If your heart is set on repeatedly counting to nine, or on saying the word putty until you die, then (on this view) succeeding in such tasks yields a life as good as can be for you.

But a promising youth may have a death wish; an oppressed slave may want only to serve her master; a decent but self-hating man may most want to be publicly humiliated. We can imagine these desires fulfilled, and yet the resulting lives appear to be impoverished, rather than enviable. Indeed, we regard such people as unfortunate precisely because of what they want—their desires are not fit to be satisfied, because they fail to aim for worthy ends.

To say such a thing, however, is to side with the objectivist, and to reject an essential element of the desire theory. For the desire theorist, nothing but satisfied desires makes us better off, and there are no objective standards that elevate some basic desires over others. On this view, value is in the eye of the beholder, and so those who prefer to publicly expose themselves or to steal worthless trinkets may really be living the best life a human being can live.

Compare two lives. The first is that of a successful professional musician who takes great enjoyment in seeing new cities, cooking gourmet meals for her beloved family, taking fine nature photos, and running marathons. The second is that of a partially lobotomized adult who has enough cognitive powers to have informed desires, though not very many, and none of great complexity. If you were deciding between them, solely on the basis of self-interest, wouldn't you choose to have the musician's life—even if you knew that it contained fewer satisfied desires?

Some adults have the mental powers of an infant or a very small child. I am not claiming that such people have nothing to live for, or that their lives cannot be good ones. I am assuming, however, that such lives are not the very best ones that human beings can lead. And yet they may contain the greatest number of satisfied desires, especially if the relevant desires are very easy to fulfill. If the desire theory is true, the quality of life in such a case is unsurpassed. That, too, is very difficult to accept.

Further, suppose that all of your deepest desires have been satisfied, but that this leaves you only completely miserable. The desire theorist must regard this as the best sort of life, whereas most of us would think it horrible to be in such a situation.

I think that the challenges recorded here are serious enough to cast doubt on the desire theory, in any of its versions. Getting what we want is not, it seems, an essential part of the good life. It is neither a guarantee of it, nor a requirement.

What, then, holds the key to the good life? Happiness is surely a part of it; it can't be good for a person to go through life without any enjoyment.

---

at all. But as earlier discussions have shown, there is more to the good life than happiness. The conclusion we are forced to is that the good life depends on objective values, things that are valuable even if we fail to value them. Happiness is one objective value. Autonomy is another. There are doubtless others. These are things worth wanting, things that we ought to obtain or achieve if we seek the best life for ourselves. Want the complete list? The only way to get it is by doing (a lot) more philosophy.

Discussion Questions

1. Can something be good for you, even if you don't want it? How do you think the desire theorist would respond to (supposed) instances of this?
2. What does it mean for a desire to be “informed”? Why might the satisfaction of uninformed desires fail to contribute to our well-being?
3. Why is the phenomenon of feeling disappointed at getting what you want a problem for the desire theorist? How might a desire theorist try to defend her theory against such cases?
4. Is it possible to be “brainwashed” into desiring something that isn't really in your interest?
5. Do you agree that the good life depends on objective values? What items (if any) would appear on your list of things that have objective value?
Three Assumptions about Morality and Religion

Religion has always been the most popular source of morality. In times of need and moral perplexity, religious believers consult priests, rabbis, imams; they avidly read their sacred texts; they look for guidance to long-standing religious traditions. All of this is perfectly natural.

Since hundreds of millions of people view morality through the lens of one religion or another, it is important that we examine this relationship carefully. We aren't going to try to determine here whether God exists; nor are we going to explore specific doctrines that separate one religion from another. Instead, I want to take a step back and examine three central assumptions that underlie the widespread view that morality depends on religion:

1. Religious belief is needed to get us to do our duty.
2. Morality must be created by someone, and God is by far the best candidate for the job.
3. Religious wisdom is the key to providing us with moral guidance.

Let's examine these assumptions in order.
First Assumption: Religious Belief Is Needed for Moral Motivation

A popular argument in favor of the religious life states that atheism 1 (the view that God 2 does not exist) prevents us from seeing why we should be moral. And if we are blinded to our reasons to be good, then we will probably be bad. Without belief in God, people are more likely to stray from the path of virtue. It will be harder for them to sacrifice self-interest when duty calls. But once God is in the picture, our will is strengthened. Religious people are going to be more conscientious than atheists or agnostics (those who are unsure whether God exists or not).

This may be true. If it is, what would explain it?

The most popular answer cites our fear of God and our desire for a happy afterlife. The thought of spending eternity in flames, or divorced from God's love, is a pretty powerful check on our immoral impulses. If God exists, justice will eventually be done—and woe, then, to the sinner. Good deeds will be rewarded, if not here on earth, then in an other-worldly paradise. So believers have very strong reasons to be moral. Non-believers don't have such reasons. They will therefore fall more easily into temptation.

Suppose this is correct. Still, this wouldn't show that religious people are more likely to do good. It would only show that they are more likely to be conscientious. But being conscientious doesn't always translate into doing good. Some of the leaders of the Inquisition were very conscientious. Their conscience led them to torture their victims in an intensely cruel way. Religious conviction may strengthen our commitments. But religion has sometimes asked its followers to wage war, not peace; to kill; to take the land and wealth of others; and to destroy the cultures of non-believers. Religion doesn't always help us to become better people. It all depends on whether the religious principles we believe in are morally good in the first place.

But let's imagine a best-case scenario, one in which our religious views are morally attractive. And suppose that religious believers really are more likely than non-believers to be conscientious. What would this show? It would not show that God exists. Nor would it show that morality depends in any way upon God. Rather, it is an argument for the practical benefits of certain religious beliefs. It says that believers with morally good views are more likely than non-believers to do the right thing.

Yet the benefits of holding a belief are one thing, its truth another. For all that this reasoning shows, religious beliefs may simply be useful fictions, false beliefs that do a lot of good.

I am not saying that this is so. In fact, let us grant, for argument's sake, that some set of religious beliefs is correct. Still, this account of how religious belief strengthens our moral motivations is problematic. The reason is simple. If hope for heavenly reward or fear of God's anger is what prompts us to do good, then we may well do the right thing—but for the wrong reasons.

To see this, imagine a person who does her duty, but only because she thinks that God punishes those who misbehave and rewards those who act morally. Such a person is not well motivated. She is doing her duty not because she loves God, but rather because she sees God as threatening the worst punishments or offering the best bribes. Such a person is unreliably moral, for if she came to believe that God really didn't offer the expected rewards and punishments, then she would see no reason to be moral.

Fear of God has been a traditional way to get people to do their duty. But when it is effective, it undermines moral character, rather than supports it. People who deserve our praise and admiration are those who do their duty for its own sake. Rather than acting from ulterior, self-interested motives, they do what is right because it is right. Agnostics and atheists have just as much reason to adopt this attitude as theists do.

Even if fear of God is the most effective way to get people to do what they should, this would not show that God exists. It would not show that religious beliefs are correct. And, crucially, it would not show that atheists or agnostics are unable or unlikely to behave in morally admirable ways. Being well motivated requires a love and respect for the morally important things in life. Religion has often fostered such an outlook. But it isn't required to do the job.

1. All terms and phrases that appear in boldface are defined in the Glossary at the end of the book.
2. The God discussed in this chapter is the one endorsed by traditional monotheistic religions: a perfect being who is omniscient (all-knowing), omnipotent (all-powerful), and morally flawless. For simplicity's sake, I also rely on traditional usage and refer to God as a male, though nothing that follows hangs on this usage. I recognize that there are important religious views that reject monotheism, as well as this specific conception of God. Most of the discussion in this chapter applies even to these views, but in some cases the focus must be narrower. At those points, I thought it made sense to address the views likeliest to be shared by my readers.
Second Assumption: God Is the Creator of Morality

“If God is dead, then everything is permitted.”

Many people feel the force of this thought, recorded by one of Dosto­evsky’s characters in his novel The Brothers Karamazov. On this view, atheism spells the doom of morality.

The underlying idea seems to be this: because morality is a set of norms (i.e., standards that we ought to live up to), there must be someone with the authority to create them. Without God, there is no one but we human beings to make up the moral law. And we lack the needed authority to do the work. Our say-so doesn’t make things right; our disapproval cannot make things wrong. We are limited in understanding and bound to make mistakes. A morality built upon our imperfections would lack credibility.

But a morality created by God—that is a different story entirely. After all, God is wholly perfect. What better credentials could there be for drafting a moral code?

Add to these credentials the following vision. Imagine a godless universe, lacking any divine purpose. Where would moral norms come from? If we are wholly material beings, governed by physical laws, then there are many ways that we will behave. But there seems to be no way that we ought to behave. If we are just very complex bundles of matter, without any externally imposed aims or purposes to live up to, then it is difficult to see how there can be moral duties at all. To get moral requirements into the picture, we must have someone with the authority to impose those duties on us. Only God could possibly qualify.

This vision of God’s role in morality—as its ultimate author, the one who makes up the moral code—rests on a crucial assumption: that morality must be created by someone. This assumption serves as the first premise of a popular Argument for God’s Creation of Morality:

1. Every law requires a lawmaker.
2. Therefore, the moral law requires a lawmaker.
3. Humans cannot be the author of the moral law (since we are imperfect in so many ways).
4. If humans cannot be the author of the moral law, then God is its author.
5. Therefore, God is the author of the moral law.\(^3\)

\(^3\) A variation on this argument, which seeks to show that moral rules are objective only if God exists, is considered in the final chapter, pp. 328–30. That discussion primarily focuses on the claim that laws require lawmakers.

This line of thinking leads directly to the following view, known to philosophers as the **Divine Command Theory:**

An act is morally required just because it is commanded by God, and immoral just because God forbids it.

I think that this is the natural, default view for a religious believer when thinking of God’s relation to morality. But it is not without its problems.

There are two of them. One is obvious. The Divine Command Theory makes morality dependent on God’s commands. But God may not exist. Or, as deists believe, God may exist, but may not command us to do anything. Deists claim that God set creation in motion, and then retired to survey His universe, refusing to involve Himself in human affairs. If the Divine Command Theory is true, and if either atheism or deism is correct, then nothing is right or wrong. Morality would be a complete sham.

But let’s assume that God does exist, and does care enough about us to tell us what to do. Still, there is a significant problem with the theory, a problem that was first recognized by Plato about a two and a half millennia ago.

In the *Euthyphro,* a short dialogue concerning the nature of piety, Plato has the title character pompously prattling on about what is and isn’t pious. In response to Socrates’ asking for its essence, Euthyphro declares that piety is whatever is loved by the gods. Socrates then poses the following question: “Do the gods love actions because they are pious, or are actions pious because the gods love them?”

Euthyphro immediately starts to get nervous. A very reasonable response. Socratic interrogation rarely leaves your pride intact.

Euthyphro thinks that the first option is the better one. He is right (but for the wrong reasons, as it happens). By the end of the dialogue, Euthyphro is humbled. And we are enlightened.

With a few substitutions, we can get a newer version of Socrates’ question that is more relevant to our topic: “Does God command us to do actions because they are morally right, or are actions morally right because God commands them?”

The Divine Command Theory answers our new question by affirming the second option. Actions are morally right just because God insists that we perform them. Prior to God’s commands, nothing was right or wrong. Morality simply did not exist.

The first option says that God commands actions because they are right. This implies that God did not invent morality, but rather recognized
an existing moral law and then commanded us to obey it. But God created everything. Therefore, He also created morality. Therefore, the first option is impossible.

But it is not impossible. In fact, it is the option that theists (those who believe in God) ought to prefer. Indeed, most religious philosophers reject the Divine Command Theory.

To see why, let us suppose that the theory is correct. Now imagine the point at which God is choosing a morality for us. God contemplates the nature of rape, torture, and treachery. What does He see? Being omniscient (all-knowing), God sees such actions for what they are. Crucially, He sees nothing wrong with them. They are, at this point, morally neutral. Nothing, as yet, is right or wrong.

But God did, at some point, make a decision. He forbade rape, theft, and most kinds of killing. If the Divine Command Theory is correct, then He didn't forbid them because they were immoral. So why did God forbid them?

It may be presumptuous of us to try to answer that question. But we can ask a slightly different question: did God have reasons for His decisions, or not?

If the Divine Command Theory is true, then there is trouble either way. If God lacks reasons for His commands—if there is no solid basis supporting His decisions to prohibit certain things, and require others—then God's decisions are arbitrary. It would be as if God were creating morality by a coin toss. But that is surely implausible. That sort of God would be arbitrary, and thus imperfect.

So a perfect God must have had excellent reasons for laying down the moral law as He did. But then these reasons, and not God's commands, are what makes actions right or wrong. Actions are not right because God commands them. Whatever reasons support God's choices also explain why actions have the moral status they do.

Suppose, for instance, that God really did forbid us from torturing others. God must have had very good reasons for doing so. While we can't presume to know God's thoughts, let's just assume for now that God based His decision on the fact that torture is extremely painful, humiliating, and an attack on a defenseless person. Assuming that these are the relevant reasons, then these reasons, and not God's say-so, are what makes torture immoral. These reasons can fully explain why torture is wrong. Torture is wrong because it is extremely painful, humiliating, and so on.

God's condemnation does not turn a morally neutral action into an immoral one. Rather, God recognizes what is already bad about torture. There is something in the very nature of torture that makes it morally suspect. Since God knows everything, God knows what is detestable about torture. Since God wants us to be good, God orders us not to attempt such actions. God commands us to refrain from torture because torture is immoral.

The Euthyphro Argument summarizes this line of thinking:

1. Either God has reasons that support His commands, or God lacks reasons for His commands.
2. If God lacks reasons for His commands, then God's commands are arbitrary—and that renders God imperfect, undermining His moral authority.
3. If God has reasons that support His commands, then these reasons, rather than the divine commands, are what make actions right or wrong—thereby refuting the Divine Command Theory.
4. Therefore, either God is imperfect, or the Divine Command Theory is false.
5. God is not imperfect.
6. Therefore, the Divine Command Theory is false.

To avoid portraying God as arbitrary, we must assume that He issues commands based on the best possible reasons. And here are the best possible reasons: God sees that an action such as torture is immoral, sees, with perfect understanding, that such things as kindness and compassion are good, and then issues the divine commands on the basis of this flawless insight. This picture preserves God's omniscience and integrity. But it comes at the expense of the Divine Command Theory, and God's authorship of the moral law.

And after all, what is the alternative? If there is nothing intrinsically wrong with rape or theft, then God could just as well have required that we do such things. He could have forbidden that we be generous or thoughtful. But this makes a mockery of morality, and of our view of God as morally perfect.

The Divine Perfection Argument expresses this point:

1. If the Divine Command Theory is true, then a morally perfect God could have created a flawless morality that required us to rape, steal, and kill, and forbade us from any acts of kindness or generosity.
2. A morally perfect God could not have issued such commands—anyone who did so would be morally imperfect.
3. Therefore, the Divine Command Theory is false.

The first premise is certainly true. The Divine Command Theory says that God's choices wholly determine morality, and that nothing determines God's choices. If God's choices were fixed in advance, the only plausible explanation would be that certain kinds of actions were already right and others already wrong, and that God, in His infinite wisdom, knew this and issued His commands accordingly. But that is to deny the central idea of the Divine Command Theory.

The second premise is highly plausible. A moral code that required such horrific acts, and forbade such good ones, could not be authored by someone worthy of love and worship, someone fit to serve as a model of moral perfection.

In my experience, many religious people still feel suspicious about rejecting the Divine Command Theory. They worry that the theory is needed to preserve God's perfection. If God doesn't create the moral law, then how can He be perfect?

True, abandoning the Divine Command Theory does mean giving up the view that God is the author of morality. But this is actually needed in order to preserve God's perfection. If God doesn't create the moral law, then how can He be perfect?

Third Assumption: Religion Is an Essential Source of Moral Guidance
Theists are often reluctant to reject the Divine Command Theory because they think that rejecting it leaves God entirely out of the moral picture. But it doesn't.

Suppose that God exists, but is not the author of the moral law. God could still play a crucial role in morality—not by being its inventor, but by being its infallible reporter, and our expert guide. God knows everything—including every single detail of the moral law. And if God is all-loving, then God will want to share some of that wisdom with us. How will He do it? By means of revelation, either personal and direct (say, by talking to you or giving you signs of certain kinds), or by indirect means (say, by inspiring the authors of a Bible).

Importantly, religious believers who reject the Divine Command Theory could easily accept the following claim:

An act is morally required if God commands it, and is immoral if God forbids it.

This looks like the Divine Command Theory, but it is importantly different. This view does not claim that acts are right and wrong because of God's commands. God's commands don't make actions right (or wrong). But if God exists, then His verdict is nonetheless morally decisive. God will never make a mistake. If God commands you to do something, then, morally speaking, the matter is settled.

God doesn't have to be the author of morality in order to play a vital role in teaching us how to live. We can see this by considering an analogy. Imagine a perfectly accurate thermometer. If we wanted to know the temperature, we'd look to this device. But the thermometer is not creating the temperature. It is recording it in an error-free way. If we reject the Divine Command Theory, then God is playing a similar role regarding morality. He is not creating the moral law. He is telling us what it is, in a way that is never mistaken. His decrees, which come from perfect knowledge and a deep love for His creatures, can be extremely helpful in guiding us to an understanding of right and wrong.

There are some worries, of course. Here are some worth mentioning:

- Those who are not religious will need to look elsewhere for moral guidance.
- Perhaps they may be right to do so, since God may not exist.
- Further, God may exist—and yet not offer any advice to us.
This is the God of the deists. To rightly trust religious texts or religious authority, you must first have more reason to believe that God exists and relays moral wisdom to us than the reverse.

Even if God exists, and offers us moral advice, there are still two serious problems for those who seek divine guidance:

- We must select a source of religious wisdom from among many choices.
- We must know how to interpret that source.

These two problems can be illustrated by working through a popular Argument from Religious Authority:

1. If the Bible prohibits abortion, then abortion is immoral.
2. The Bible prohibits abortion.
3. Therefore, abortion is immoral.

The first premise asserts the moral authority of the Bible. But which bible? Different religions offer us different sacred texts, whose details sometimes contradict one another. So we must choose. There is presumably one right choice and many wrong ones. The odds are stacked against us.

Premise 1 is plausible only if God has authored the Bible, or dictated its terms. Religious believers therefore have to make a case that this is so. They must justify the claims that God exists, that God has communicated with humanity, and that their favorite bible is the one that contains God's wisdom. It won't be easy to do this.

If God is all-powerful, then He could provide some extremely clear, undeniable evidence to settle these matters, evidence that would convince agnostics, atheists, and members of competing religions. But God has thus far chosen not to do this. That makes defense of premise 1 especially tricky.

And the challenges don't end there. Even if theists can adequately defend the first premise, and so justify the selection of their preferred bible, there is the further matter of how to interpret the sacred text. Neither the Hebrew nor the Christian scriptures, for instance, ever explicitly mention abortion, much less prohibits it. So if the second premise can be defended, it must be in virtue of a nonliteral reading of the text. And yet, as we all know, there are very learned people, deeply familiar with these religious texts (and traditions), who will in good faith argue for premise 2, and others, equally well equipped, who will oppose it.

In this regard, debates about how best to interpret a bible are very much like those that surround Supreme Court jurisprudence. Consider, for instance, the Second Amendment to the U.S. Constitution: "A well regulated militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed."

Does this amendment allow states to ban the private purchase of handguns or semiautomatic weapons? Is a mandatory waiting period or a background security check compatible with this passage? A literal reading of the text cannot settle the issue. The Constitution and its amendments also never explicitly mention school desegregation, contraception, privacy, or interracial marriage. And yet brilliant lawyers have produced thoroughly documented arguments that support many different (and incompatible) views of our legal rights on these matters.

No text is self-interpreting. When we come across any document that claims to be authoritative, there are bound to be disagreements about how best to understand it. The Constitution does not itself contain any advice on how to interpret its passages. Neither do the sacred texts of the major world religions.

Those who argue for a literal reading are bound to meet with difficulty. There will be many important topics that are never mentioned in the crucial text. Those that are may receive contradictory treatments (consider, as an early example, the literally incompatible creation stories of Genesis chapters 1 and 2). There may also be morally troubling advice on offer (think of the passages in Leviticus that permit slavery and the subordination of women, or those that require killing adulterers and disrespectful children).

Yet if we move away from a literal reading, we are faced with countless possibilities for interpreting the biblical texts. Believers must choose among them, and justify their choice in the face of a wide number of conflicting approaches. A defense of premise 2 is, therefore, no easy matter.

A final difficulty comes when having to balance the demands of a sacred text with the layers of tradition that form a crucial part of any living religion.

When your interpretation of a religious document conflicts with long-standing religious practice, or the advice of generations of religious authorities, which should win out? Consider as an example the famous eye-for-an-eye principle, which seems to be clearly required by God in the Hebrew scriptures (Exodus 21:23; Leviticus 24:20; Deuteronomy 20:21). Yet Jewish communities and their religious leaders have, for at least two millennia, read the decree in an imaginative, nonliteral way, softening its
implications for wrongdoers and extending the principle to apply to cases where it cannot be taken literally. Does the text take priority over traditional practice and religious authority? Or is it the other way around? Believers must have a plausible view about how to settle such conflicts. Without one, their take on what God really wants for us may be very wide of the mark.

To summarize: those who seek divine guidance in trying to lead a moral life may succeed. But several conditions must be met. It must be the case that (1) God exists, and that we can be justified in believing this. (2) God must offer us moral advice, and we must be able to defend the claim that He does so. Further, (3) theists must be justified in selecting a particular source of religious and moral wisdom, such as the Koran, the Book of Mormon, or the Christian scriptures. Theists must also (4) defend specific interpretations of those sources. Finally, when an interpretation conflicts with tradition, religious believers must (5) successfully argue for the priority of one over the other.

This is a daunting list. Yet philosophy is full of such lists, and the difficulty of a project is not, by itself, proof of its failure. Religious believers have their work cut out for them, no doubt of it. But then so does everyone else.

Conclusion

There is a great deal to think about when discussing the relation between morality and religion. I have narrowed the focus to three major assumptions, because these seem to lie at the heart of most debates about God’s role in morality.

Is God needed to ensure that we are morally motivated? No. Morally admirable behavior comes when we do our duty for its own sake, rather than from self-interest. Fear of God, or desire for heavenly reward, do not necessarily tarnish our character. But they are no substitute for a direct love of morality, which can be displayed as much by atheists as by religious believers.

Does God create morality? No. Rather, God (if He exists) understands everything, and so knows precisely what is wrong with such things as rape and torture, and right about such things as compassion and kindness. He issues commands on the basis of this perfect understanding, out of love for His creatures. A God who issues commands for good reasons will rely on the very best reasons—and those can explain, all by themselves, what is right and wrong.

Does religion offer reliable moral guidance? Possibly. That depends on many things—whether God exists and speaks to us, whether we can know which texts are divinely written or inspired, whether we can defend our favored interpretations against the competition, and whether we can balance these interpretations against the importance of religious tradition and authority in cases of conflict.

In the rest of the book, I do not make use of specifically religious claims. There are two reasons for this. First, we have seen the many challenges to the assumption that morality is based on religion, and it is worthwhile seeing how far we can get without having to rely on that assumption. Second, there is important precedent among religious philosophers for thinking that God gave us reason and understanding in order to make the fundamental truths of morality available to everyone. After all, a caring God would want even nonbelievers to understand the immorality of rape and genocide, and to appreciate the goodness of generosity and loving kindness.

Let us proceed, then, to consider the views of those who, in most cases, were religious themselves, but who sought secular foundations for the moral theories they developed.

Discussion Questions

1. How might religion motivate people to behave morally? Why is this kind of motivation sometimes thought to be morally problematic?
2. Does the existence of a law imply the existence of a lawmaker? Defend your answer.
3. Describe the two possible relationships between God’s commands and morality suggested by Socrates. Which account do you find more attractive and why?
4. There are many different religious texts offering us moral guidance, and some of them give conflicting advice. Is there a reliable way of deciding which text (if any) is correct?
5. All things considered, do you think religion is a good source of moral guidance? Why or why not?
The Theory and Its Attractions

You are an animal.

I’m not trying to insult you. Just stating a fact. I am an animal, too. And so is everyone else we know. The basic needs of animals—food, water, security, companionship, freedom from pain—are the basic needs of human beings. All humans, like every other animal, share the same fundamental plight: certain one day to die, and vulnerable to harm in the meantime. Perhaps the key to morality lies in understanding our place in the natural order of things. Many have thought so.

In trying to discover what makes for a good human life, we might take a cue from the rest of the animal kingdom and ask about why their lives go well, when they do. It seems that there is a common answer: animals live good lives when their nature is fulfilled, and bad lives when it isn’t. A racehorse, by nature, is built for speed. English pointers are meant to aid in the hunt. Chameleons naturally blend in with their background. When fillies break a leg, or chameleons cannot camouflage themselves, their lives go poorly. A good pointer will be able to track and give chase; a bad one will sit lazily and ignore nearby prey.

In each of these cases, nature is dictating the terms of appraisal. The things in nature have a nature. Such things are bad when they are unnatural, and good to the extent that they fulfill their nature. Perhaps we can say the same thing about human beings.

That is the guiding thought of the natural law theory. By its lights, good human beings are those who fulfill their true nature; bad human beings are those who don’t. The moral law is the natural law—the law that requires us to act in accordance with our nature. (As we’ll see, this is a different kind of natural law from the one that physicists use to describe the workings of molecules or galaxies.) At its most basic, natural law theory tells us that actions are right just because they are natural, and wrong just because they are unnatural. And people are good or bad to the extent that they fulfill their true nature—the more they fulfill their true nature, the better they are.

The natural law theory promises to solve some very serious problems in ethics. Four of these are especially important.

1. Natural law theory promises to explain how morality could possibly be objective, that is, how moral standards depend on something other than human opinion.

According to this theory, human nature can serve as the objective standard of morality. We do right when our acts express human nature, and do wrong when they violate it. Since individuals and entire societies can be mistaken about what our true nature is, they can be badly off target about what morality asks of us.

Although many natural law theorists are theists, who claim that our nature was given to us by God, that is not an essential element of the theory. What is crucial is that human nature is meant to serve as the ultimate moral standard. If this theory is correct, then so long as there is such a thing as human nature, there is an objective source of morality.

2. Natural law theory easily explains why morality is specially suited for human beings, and not for anything else in the natural world.

Almost everyone agrees that a distinctive human feature is our sophisticated reasoning abilities. A few other animals may be able to reason in basic ways, but no species on earth can approach our ability to assess various ways of life, critically analyze the merits of actions and policies, and then govern our behavior on the basis of our reflections. This capacity for rational thought also seems to be the cornerstone of morality. Moral agents—those who bear responsibility for their actions, and who are fit for praise or blame—are those who can control their behavior through reasoning. That’s why we don’t hold animals (or trees or automobiles) morally responsible for the harms they sometimes cause. Only human beings have the sort of nature that enables them to be moral agents. Natural law theory can thus explain why moral duties apply only to human
beings (or, if we ever discover them, to other life forms who share our rational powers).

3. **Natural law theory has a clear account of the origins of morality.**

The theory tells us that morality is only as old as humanity itself, that morality dates to the earliest days of humankind. But that isn’t because morality depends on human opinion, as so many people believe. Rather, it is because morality depends on human nature. No humans, no human nature. No human nature, no morality. That’s why there are no such things as eternal moral laws.

4. **Natural law theory may solve one of the hardest problems in ethics: how to gain moral knowledge.**

There are many skeptical arguments that try to undermine hopes for moral wisdom. Here is a perennial favorite, a variation on an argument developed by the brilliant Scottish philosopher David Hume (1711–1776). Let’s call this Hume’s Argument, in his honor:

1. We can know only two sorts of claims: conceptual truths or empirical truths.
2. Moral claims are neither conceptual truths nor empirical truths.
3. Therefore, we can have no moral knowledge.

A **conceptual truth** is one that can be known just by understanding it. Here are some conceptual truths: No sphere is a cube; all integers are even or odd; bachelors are unmarried males; if A is taller than B, and B is taller than C, then A is taller than C. You can close your eyes to the world, just think about these claims, and know that they are true.

Empirical truths are not like this. They are known only by relying on evidence from our five senses. Here are some empirical truths: I live in a house that was built in 1915; it was raining in London on June 25, 2007; the Pacific Ocean is larger than the Atlantic; David Hume never married.

Suppose we agree with the plausible claim that all knowledge is of either conceptual or empirical truths. If that is right, and if moral claims are neither, then moral knowledge is impossible.

Why aren’t moral claims conceptual truths? Because for any moral claim, we can completely understand it and still wonder whether it is true.

That doesn’t happen when we ask whether bachelors are unmarried or whether spheres are cubes. Anyone who really understands those questions already knows the answer.

Why aren’t moral claims empirical truths? Because we don’t discover them by means of our senses. No amount of scientific probing into the world will reveal any moral features in it. If you witness a murder, or a broken promise, you will notice many things. But you can’t see its wrongness.

Hume had a supporting reason for thinking that moral knowledge could not be empirical. Empirical knowledge tells us how to describe the world. And when we describe the world, we talk about what is the case. But morality speaks of what ought to be the case. How can we get from descriptions to prescriptions? How does knowing how the world actually works enable us to learn how it ought to work? Hume thought that there was no answer to this question. If he is right, there is a gap between what is and what ought to be, a gap that can never be crossed.

Suppose we describe an act in the following terms. The act was an instance of a painful killing. The victim was a child. The child was terrified. The killer picked his victim because the child was an easy target. The killer felt no remorse. If Hume is right, then no matter the number of descriptions we pile on, logic will never tell us which moral conclusion to draw from this evidence.

Of course we think that this act is immoral. But the claim that such a killing is immoral cannot be established by empirical evidence. Nor can conceptual truths establish it. Since all evidence must take one form or the other, it follows that we can never be justified in our moral views.

Natural law theory claims to be able to solve Hume’s challenge. According to the theory, moral knowledge requires two things: we must know what our human nature is, and know whether various actions fulfill it. Natural law theorists think that both kinds of knowledge are empirical.

Human beings are part of the animal kingdom. We learn the true nature of other animals by careful scientific study. And the same holds for human beings. Discovering the essence of human nature is a scientific enterprise. Armed with this empirical knowledge, we can then look carefully at individuals to see whether their actions line up with human nature. This careful examination is empirical, too.

Suppose, for instance, that we perform a vast study of human infants, across many different cultures, and discover that they are gentle and non-violent. Many have thought that this sort of empirical evidence clinches the case for thinking that these traits are part of human nature. If we then...
see people acting aggressively and violently, we have all the evidence we need to convict them of immorality. That's because they would be acting in conflict with their true nature.

So, on the natural law view, gaining moral knowledge need not be mysterious. Armed solely with descriptions of a person's behavior, and knowledge of our human nature, we can determine whether actions are moral, by seeing whether they fulfill our nature.

Just as we can tell whether a cheetah is a good member of its species by observing its speed, its talent for hunting, and so on, we can determine whether human beings are good or bad just by taking careful note of their actions and intentions. All we need is to conduct a scientific study of human nature, and then observe whether various actions fulfill that nature. This will amount to a good deal of empirical, descriptive knowledge, which will allow us to draw moral conclusions about people and their actions. If natural law theorists are right, you really can derive an ought from an is.

Two Conceptions of Human Nature

We often approve of actions by declaring them to be perfectly natural, or excuse someone's harmful conduct by saying that it was the natural thing to do under the circumstances. We also condemn certain actions as unnatural, or say of an especially awful act that it was a crime against nature. This all makes excellent sense, on the assumption that natural law theory is true.

The central claim of the theory is that the moral is the natural: The ideal for human beings is to fulfill their nature. Much depends, then, on what our nature really is.

In general terms, human nature is what makes us humans. It is the set of features that is essential to being human, so that if we were to lose these features, we would also lose our humanity. Natural law theorists are committed to the idea that there is a human essence, a set of traits that define us as human beings.

What is the nature of human nature? Here are two familiar—and problematic—answers.

Human Nature Is What Is Innately Human

Innate traits are ones we have from birth. They are natural in the sense of being inborn, natural as opposed to being learned, or acquired from parents and society. On this line of thinking, our true nature is the one we are born with; traits we acquire through socialization are artificial, and stain the purity of our earliest days. In principle, we can use scientific methods to discover what is innately human, and so solve Hume's challenge to gaining moral knowledge.

If Jean-Jacques Rousseau (1712–1778) was right, we are innately angelic. Before society corrupts us, our noble nature shines through. We are by nature pleasant, cooperative, and considerate. If our nature holds the key to morality, then morality is largely as we think it is. It requires us to be kind, cooperative, and attentive to the needs of others.

That would be a comfort. But what if Thomas Hobbes (1588–1679) had it right? He thought that we are innately selfish, competitive, and distrustful. We are born that way and, for the most part, stay that way. If the natural is the innate, and if we are required to act on our true nature, then the Hobbesian view is going to force us to abandon many of our conventional ethical beliefs.

The view that the natural is what is innate is widely held. This is what explains why so many people think that studies that are focused on infants will unlock the key to human nature. The thought is that society is bound to change our natural state, and so we gain the deepest insight into human nature by discovering what we are like before society changes us in so many ways.

Yet if natural law theory is correct, and if the natural is the very same thing as the innate, then we need to resolve the nature/nurture debate before we can know what is right and wrong. And that seems mistaken. We are very confident that morality is not a counsel of selfishness, mistrust, and competition, even if we are uncertain about whether such traits are innate. We can be very sure that killing people because of their skin color is immoral, even if we aren't sure whether we have an innate tendency to harm people who don't look like us.

This raises a general point: the ultimate origins of our impulses are irrelevant to the morality of our actions. Rape and robbery are immoral, no matter whether the impulse to commit these crimes is innate or acquired. Cheerfully comforting the sick is a good thing, even if we weren't born with a desire to offer such help. Since the morality of our actions and our character traits does not depend on whether they are innate or acquired, natural law theorists must look elsewhere for an understanding of human nature.

Human Nature Is What All Humans Have in Common

Many people think that our nature is whatever traits we all share. These universal human features would make up the essence of humanity. Such a
view lets us scientifically determine our human nature. The data wouldn't always be easy to come by. But with a lot of effort, we could discover the essence of human nature just by observing the features that all humans have in common.

There are two problems with such a view. First, there may be no universal human traits. And second, even if there are, they may not provide good moral guidance.

It may seem silly to deny that there are any universal human traits. Doesn't everyone want to have enough food and water to remain alive? Don't all adults have a sex drive? Aren't we all capable, to one degree or another, of complex thinking about our future? Yet some people want to die, not to live; others are indifferent to the attractions of sex; still others are so mentally impaired as to be unable to think at all about their future. For just about any trait (perhaps every trait) that is said to be part of human nature, we can find exceptions that undermine the rule.

Natural law theorists have a reply to this, which is best appreciated by considering an example. Return to the case of nonhuman animals, and think about their nature. For instance, it is part of a buck's nature to be alert to predators, to have four legs, to grow antlers, and to be fawn-colored. Still, there are bucks with only three legs. A few fail to grow antlers; others are deaf to predators; still others are albinos. We might say of such specimens that they aren't really bucks, not fully bucks, or not all that a buck should be.

If that sounds right, then we might adopt the following strategy. Perhaps human nature, like that of nonhuman animals, is determined not by what every member of the species shares, but only by what most members share. Bucks can have a nature, even if some bucks fail to perfectly live up to it. The same goes for human beings.

But this strategy won't work. There is the difficult problem of setting a threshold. Just how many humans need to have a trait before it qualifies as part of human nature? But leave that aside. The real problem is this: the fact that most humans have a certain trait is morally irrelevant.

Suppose, for instance, that most of us are selfish and mean. On this line of thinking, being selfish and mean would then be part of human nature. That would make such behavior morally right, on the natural law view. But that's awfully difficult to accept.

Even if everyone, or most of us, were cruel and malicious, that would not make cruelty and malice morally good. Even if people were ordinarily, usually, or typically nasty and petty, these traits would still be vices, not virtues. The fact that many, most, or all people behave a certain way, or have certain character traits, is not enough to show that such behaviors and traits are morally good. The line from is to outh cannot be crossed so easily.

Natural Purposes

If human nature is not a matter of the (innate) traits that all or most of us have, then what is it? The answer given by most natural law theorists is this: human nature is what we are designed to be and to do. It is some function of ours, some purpose that we are meant to serve, some end that we were designed for.

It may seem that this conception of human nature places us squarely outside the realm of science, and in the domain of religion. How could science tell us what our purpose is? Doesn't talk of our being designed for something imply the existence of an Intelligent Designer?

In fact, many natural law theorists have made these assumptions, and have developed their views within the context of one religious tradition or another. On these views, God is our Intelligent Designer. When God created us, He assigned us a specific set of purposes. These are what make up our human nature. Since God is all-good, frustrating God's purpose is immoral. That's what we do when we act unnaturally. That's why it is wrong to act unnaturally.

There is a lot to say about such a view, but most of it has already been said in the previous chapter. On the present account, we must act naturally because that is the way we respect God's plans for us, which are at the heart of morality. Though this isn't quite the same thing as making God's commands the basis of morality, it is close enough to have inherited most of the strengths and weaknesses of the divine command theory. Rather than revisit that topic, let's consider a secular interpretation of natural purposes.

The challenge is to make sense of the idea that we have been designed to serve some purpose, without having to invoke an intelligent designer. Strictly speaking, of course, nature has no designs for us. Nature is not an intelligent being with intentions and plans. Still, it can make sense to speak of something's natural function or purpose. The mechanisms of evolution and natural selection, rather than God, can serve as the source of our natural purposes.

For instance, nature designed our brains to enable us to think, our liver to detoxify our blood, and our pancreas to regulate glucose levels. We
can say what mitochondria are for, what the heart and kidneys are meant
to do. In each case, there is a purpose that these organs serve, even if no
one assigned them this purpose.

But that sort of talk doesn’t easily translate to human lives. What is a
human being for? Does the question even make sense?

To answer this question, we need to understand the idea of a natural
purpose. Two basic secular accounts might offer some insight. Call the
first account the Efficiency Model, and the second, the Fitness Model.

Consider the Efficiency Model. Sticking with the example of a heart,
we can say that pumping blood is its natural purpose, because nothing
pumps blood as well as a heart. Hearts have a certain structure that enables
them to pump blood more efficiently than anything else in the body. That
is why the purpose of a heart is to pump blood.

Human beings can have a function or a purpose, then, if we are more
efficient than anything else when it comes to certain tasks. Well, we are.
But there are so many of them. For instance, we are better than anything
else at designing puzzles and writing essays. But on this model, natural law
theory cannot be correct, given its claim that unnatural action is immoral,
for that would mean that we act immorally whenever we are bad at puzzle
design or essay writing. We are also far better at building weapons than
any other animal, and far more talented at using instruments of torture.
But if acting naturally is always morally acceptable, then these actions, if
they really are among our natural purposes, are beyond reproach. Some­
things has gone wrong.

If the Efficiency Model is correct—if human nature is given by our
natural purposes, and these purposes are whatever we are best able to
accomplish—then natural law theory must fail. There are too many such
purposes, and many have nothing moral about them. Perhaps the Fitness
Model will do better.

On this account, our organs have the purposes they do because it is
extremely adaptive for them to serve these roles. The natural purpose of
the heart, brain, liver and lungs is to do what enhances fitness: roughly,
our success at survival and reproduction. We are able to survive, and pass
on our genes to our offspring, only because these organs function as well
as they do. Nature has designed hearts and kidneys and brains (etc.) to
improve our chances of survival. This is their natural purpose; it is ours,
too. We are meant to survive, and to transmit our genes to the next
generation. That is what a human life is for. In a godless world, that is all the
purpose our lives can have.

Since our natural purposes are survival and procreation, we can see why
so many natural law theorists have thought suicide immoral, and have con­
demned birth control and homosexual activity. We also have a ready expla­
nation of why courage, endurance, and fortitude are true virtues—those
who possess them are (in the relevant sense) fitter than those who don’t.

Suppose that the natural law theory is true. And suppose that we fulfill
our human nature just when we fulfill our natural purposes. Two things
follow:

1. Acting naturally—fulfilling our natural purpose—is always moral.
2. Acting unnaturally—frustrating our natural purposes—is always
imoral.

But if the Fitness Model is correct, then both claims are false.

Claim 1 is false. To see this, recall that natural actions are those in
which we use our mind and body to satisfy the purposes they were
designed for. In the Fitness Model, these purposes are survival and repro­
duction. So natural actions are those that increase the chances of our
survival and reproduction. But men can increase the chances of passing on
their genes by raping as many women as they can. That is about as immoral
as anything I can think of. And survival? Consider the words of Primo
Levi, an Auschwitz prisoner: “the worst—that is, the fittest—survived. The
best all died.” Sometimes those best schooled in violence and treachery
are the ones likeliest to live another day. If we understand natural purposes
as the Fitness Model advises, then claim 1 is false.

Claim 2 is also false. Not every act that frustrates a natural purpose is
immoral. Nature has engineered our ears to be capable of hearing— the
better to detect predators, to listen to the advice of our allies, to hear the
threats posed by our attackers. But there is nothing immoral about wear­
ing a set of headphones that block out noise. We have eyes so that we can
see. But there is nothing wrong with crossing your eyes to make a joke, or
closing them to shut out an unwanted sight.

It is worth noting that these examples can be successful even if it is
God, and not nature alone, that has endowed us with these various pur­
poses. Suppose that God made eyes to see, ears to hear. Still, isn’t it morally
acceptable to put on blindfolds, or wear headphones? Despite being
“unnatural,” these actions are perfectly acceptable.

What this shows is that the Fitness Model is as vulnerable as the Efficiency Model. Neither gives us a solid understanding of what human nature is. Until we are given a better method for determining our nature, the natural law theory is in trouble.

The weakness of the various understandings of human nature allows us to see why a classic moral argument fails. That argument—call it the Natural Law Argument—goes like this:

1. If an act is unnatural, then it is immoral.
2. Suicide, contraception, and homosexual activity are unnatural.
3. Therefore, suicide, contraception, and homosexual activity are immoral.

The first premise is false on all of the interpretations we have so far considered. Whether unnatural actions spring from acquired traits, rather than innate ones; whether they are rare or unusual, rather than typical or even universal; whether they frustrate nature's purposes rather than conform to them; still, such actions can be morally acceptable.

This does not prove that suicide, contraception, and homosexual activity are morally okay. What it shows, however, is that this popular argument is highly suspect, and will certainly fail unless we have a better understanding of human nature to rely on.

The Argument from Humanity

This may be a good time to consider another famous argument of the natural law tradition: the Argument from Humanity. This is perhaps the most widely heard antiabortion argument in public debates on the subject. The argument is straightforward:

1. It is always wrong to deliberately kill an innocent human being.
2. A fetus is an innocent human being.
3. Therefore, it is always wrong to deliberately kill a fetus.

A great deal could be said about that first premise, but let’s leave it aside for the moment, and focus on the second. It seems clearly true to a great many people. And it seems just as clearly false to many others. What is going on here?

The explanation, I think, is that the term human being is ambiguous—it has more than one meaning. There are at least two senses of the term used in these debates, and members of each camp tend to use their preferred meaning. The result is that a lot of the discussions about abortion end up going nowhere.

For our purposes, the important question is whether a fetus is an innocent human being. And that depends on how we define humanity. What is the essence of humanity? It is tempting, of course, to look to science for an answer. It tells us that being a member of the species Homo sapiens is the essence of humanity. On this biological account, premise 2 is clearly true, since fetuses of our species are certainly innocent of any wrongdoing.

But if we give a purely scientific definition of humanity, then premise 1 begs the question against pro-choice opponents. In other words, premise 1 assumes the truth of the conclusion it is meant to support. It does not provide an independent reason for rejecting the pro-choice position. Those who advance premise 1 without any supporting argument for it are preaching to the choir, since only those who already opposes abortion will accept this first premise. If humanity is defined in purely biological terms, then the first premise needs a lot of defense—indeed, as much defense as the argument’s conclusion.

Alternatively, we might think of humanity not as a biological category, but rather as a moral one. On such a view, to be human is to have a certain moral status. It is to be entitled to a broad set of moral rights, including the right to life. On this reading, premise 1 may well be true, though some critics will argue that even this moral rule has some exceptions. (We consider the matter in some detail in the chapters to come.) Still, even if premise 1 turns out to be true, the second premise, the one that grants fetuses a wide range of basic rights, just as clearly begs the question. It needs as much defense as the conclusion it is meant to support.

So the term humanity (like the term natural) is ambiguous. This isn’t any kind of problem, so long as we are very clear about which meaning we are relying on. But once we are clear about its different meanings, and make sure that the same meaning is being used in both premises, we can see that the argument is bound to beg the question. What this shows is that the argument cannot stand alone. Depending on which meaning of human we use, opponents of abortion will have to provide a strong supplemental argument to defend premise 1, premise 2, or both.

There are lots of cases like this. Here is another example, from a newspaper article I read just this morning:

1. It is morally okay to play sports.
2. Dogfighting is a sport.
3. Therefore, dogfighting is morally okay.
This argument was given by a friend of Michael Vick, the star quarterback who pled guilty to criminal charges related to his role in running dogfights. Before you had a look at this one, you might not have realized that people have different definitions of sport. But they do. Some people think of a sport as any skill-based athletic competition. Others think of it as any recreational activity. Still others consider sports to have essentially character-building and morally uplifting aspects, so that a gladiator contest, for instance, or professional wrestling, doesn’t qualify as a true sport.

None of these definitions is uniquely correct. The term sport is also ambiguous. And that’s okay. It’s a terribly impoverished language that can’t make room for ambiguity. But when we examine a line of argument that contains an ambiguous term, we must first settle on the definition we will use, and then stick with it. Only then can we test each premise to see whether it turns out to be true.

When we do that with the dogfighting argument, we can see that those who think that sports are essentially character-building will accept the first premise, but likely reject the second. And those whose definitions make no reference to morality may accept the second premise, but then, when they think about so-called blood sports, cast a suspicious eye on the first. The same pattern that we saw in the Argument from Humanity repeats itself here, and in so many other contexts.

There is a basic philosophical point here: you can’t solve complex moral problems with definitions alone. You can’t solve the abortion debate just by defining a human being in terms of species membership. Nor can you solve it if you define human being as a person possessed of basic moral rights. We can define humanity in any way we like—by reference to species, genetic code, moral rights, or to powers of reasoning, self-awareness, linguistic ability, or in any of a dozen other ways. But no matter what definition we come up with, there is no shortcut through a lot of further complicated moral argumentation. Definitions alone will never spare us the hard philosophical work it takes to solve complex moral problems.

There is no better contemporary illustration of this point than the Marriage Argument, given by many natural law theorists and other opponents of same-sex marriage:

1. Marriage is defined as a relation between a man and a woman.
2. Homosexual relations are between a man and a man, or a woman and a woman.
3. Therefore, homosexual relations can never qualify as a marriage.

The search for a definition is the search for an essence. For instance, defining bachelors as unmarried adult males is supplying the essence, the central nature, of being a bachelor. Is marriage essentially a relation between those of opposite sexes, as defenders of the argument claim? Or is its essence the expression of mutual love, honor, and commitment, as supporters of gay marriage assert? Or something else entirely?

I won’t try to settle this debate here. But the point raised earlier applies to this argument as well. The real question behind today’s debates about gay marriage is whether the state is morally required to give the same legal rights to same-sex couples that it now gives to heterosexuals. That question cannot be settled by setting forth a definition, especially one that will appeal only to those on one side of the debate. It can be settled only by examining the ultimate point of marriage, the morality of homosexuality, the proper role of the state, and other difficult matters.

Definitions are tools for thinking clearly. They clarify the subject matter and tell everyone precisely what the focus of discussion is. But having a subject firmly in mind is one thing; determining its moral status is quite another. Definitions alone will never solve a moral problem.

While this does not undermine the natural law theory, it must make us very careful of how we employ it. Even if we agree on a definition of human nature, and so on what is essential to being human, there is a great deal to do—indeed, there is almost everything yet to do—before we can draw important moral lessons about how to live our lives.

Conclusion

The deep appeal of the natural law theory is its promise to base morality on something clear and unmysterious: nature and its workings. Moral laws, on this account, are just natural laws, though ones that regulate human beings, rather than planets, molecules, or gravitational forces. But as we have seen, it is difficult to try to read off recommendations for how we ought to act from descriptions of how nature actually operates.

And that shouldn’t be too surprising. Natural laws describe and predict how things will behave. They summarize the actual behavior of things, and, unless they are statistical laws (of the sort that assign a probability to outcomes, rather than a certainty), they cannot be broken.

Moral laws are different in every respect. They can be broken, and often are. They are not meant to describe how we actually behave, but rather to serve as ideals that we ought to aim for. Nor are they designed to
predict our actions, since we so often fall short of meeting the standards they set.

Nature can define the limit of our possibilities. Our nature does not allow us to leap tall buildings in a single bound, or to hold our breath for hours at a time. On the assumption that morality does not demand the impossible of us, nature can, in this way, set the outer bounds of what morality can require. But it can do no more. It cannot, in particular, tell us what we are required to do. Nor can it tell us what we are forbidden from trying to achieve. Nature has, at best, only a limited role to play in moral theory.

Discussion Questions

1. What is the difference between empirical truths and conceptual truths? Why might someone think that moral claims don't fall into either category? Into which category would a natural law theorist put moral claims?
2. Many people think of human nature as consisting of innate traits that all humans share. Is this conception of human nature a suitable basis for morality? Why or why not?
3. Do human lives have a purpose? Does knowing the purpose of human lives help us to determine what is morally required?
4. Is there a single correct definition of human nature? If not, is this a problem for the natural law theory?
5. How are moral laws different from the laws of physics or chemistry? Do these differences undermine the natural law theory?

CHAPTER 7

Psychological Egoism

Egoism and Altruism

Early in his masterpiece, the Republic, Plato recounts a story that was well known to his readers. This is the tale of Gyges the shepherd. Trying to catch up with his wandering flock, Gyges enters a cave. On its dirt floor he finds a golden ring. He puts it on and discovers that it makes him invisible. After testing it a few times to make sure of its powers, Gyges goes to town, kills the king, captures the throne, and weds the queen. He is able to satisfy his every want. And does.

The lesson many have taken from this story is that we are always looking out for Number One. If we had the power to do as we liked, we would always seek out our own best interests, no matter the harms we caused. The only thing that keeps us in check here in the real world, where no such ring exists, is the worry about how we'd be made to suffer if we did what we most wanted to do.

In civilized society, no one is all-powerful. But this doesn't change our basic motivation. We do best for ourselves by sometimes helping others. We keep our word so that we gain the trust of those who can help us. We don't kill our enemies, for fear that we will be the next target. But no matter our position in the world, we all want the very same thing: to make ourselves as well off as we can be.

This is the view of psychological egoism, which tells us that there is only one thing that motivates human beings: self-interest. If this theory is true, then altruism—the direct desire to benefit others for their own sake, without any ulterior motive—does not exist.
In certain moods—especially when we are feeling doubts about whether people are as virtuous as they think or say they are—it is easy to believe that psychological egoism is true, and that altruism is just a comforting myth.

But sometimes it's very hard to accept such a dark view of ourselves. Just ask U.S. Army sergeants Cedric Thomas, Ian Newland, and Lyle Buehler. On December 4, 2007, they were patrolling the streets of Adhamiya, Iraq, crouched in a Humvee with their buddy Ross McGinnis, a 19-year-old army private. McGinnis had earned a reputation as the company prankster, a lean kid who was always asking difficult questions and making jokes. The crew was on the streets in an effort to identify a good location for a new generator that would provide electricity for the locals in the neighborhood. They stopped for a moment outside of a two-story building.

Kelly Kennedy, whose book They Fought for Each Other,1 tells the story of these men and the army battalion they were embedded with, describes what happened next:

McGinnis yelled over the Humvee's intercom system: “Grenade!”

The insurgents had lobbed so many grenades at the team that the guys reacted calmly, looking around for the offending weapon.

“Where?” Thomas shouted.

McGinnis yelled again: “The grenade is in the truck!”

Then Newland could hear it ricocheting around the turret, a heavy metallic drum. McGinnis tried to grab it so he could toss it back out before it blew, but he missed. He stood as if he were going to leap out of the top of the Humvee, but instead he dropped down from his fighting position into the truck. Newland thought McGinnis was trying to escape the grenade. But he wasn't. McGinnis realized that his teammates hadn't spotted it, and so he was chasing it. Newland couldn't move quickly enough to get out of the truck with its combat-locked doors, and none of the guys quite understood what was going on because McGinnis hadn't dived out.

Then Newland saw it, a fist-sized black bullet of metal. He heard McGinnis say, “It's right here!” And it was. Right on the radio mount in front of the Humvee between driver Sergeant Lyle Buehler and truck commander Thomas. Newland froze as his brain processed this information. It was there. It was live. It was going to blow.

Seconds later, the grenade exploded, blowing out the back of Ross McGinnis and killing him instantly.

We can't ask Ross McGinnis why he acted as he did. Nor can we pose that question of so many others who have made the ultimate sacrifice. Many such accounts are recorded at the fascinating website http://carnegiehero.org, which details the stories of everyday people who have made life-saving rescues at extreme personal risk. There are many reports of people jumping into freezing waters or blazing automobiles in order to save complete strangers. A number of the rescuers died in their efforts.

Why would people do such things? There seem to be many reasons. Some tried only to help a victim in need. Some felt called by duty to offer help. Others may have had mixed motives, of compassion and care on the one hand, and perhaps a small desire for praise and popularity on the other.

If psychological egoism is true, then these explanations are all wrong. None of these people was a true hero, since every one of them was driven by self-interest to save the lives of others. It is important to see how strong a claim this is. Psychological egoists are not saying that people usually act out of self-interest, or that altruism is rarer than it seems. Rather, their claim is that actions are never done from altruistic motives.

This isn't just a fluke, either. It's not as if we are capable of being altruistic, but never decide to go that route. Rather, the psychological egoist explains the absence of altruism by claiming that altruism is impossible for us human beings. We can't fly. We can't live in five-thousand-degree temperatures. And we can't be devoted to anyone other than ourselves.

True, people often do help one another. But egoists will explain this in self-interested terms. Suppose, for instance, that my boss asks me at the last minute to babysit his bratty children. I am miserable, but smile anyway and quickly agree. Though I benefit my boss, the only reason I do so is because I expect to get something from it. If I didn't—if I knew, for instance, that he was soon retiring, and was powerless to advance my career or get me a raise—then I wouldn't agree to help. Psychological egoists are well aware that people help one another in many ways. But that doesn't show that they do so from altruistic motives.

---

As its name implies, psychological egoism is a psychological view, rather than an ethical theory. It aims to describe the facts and limits of human motivation, rather than prescribe the standards that we ought to live up to. If it is true, every single action—mine and yours and everyone else's—is done from the hope of personal gain.

Many people see this view as revealing a deep truth about ourselves. And it strikes others as the height of cynicism. Those who prefer a more flattering picture of humanity, one that allows us our altruistic motives, will want to debunk the theory. It isn't easy.

We can't refute this kind of egoism just by pointing to examples, such as smoking, in which people know that they are jeopardizing their health or their life. That is because those who smoke presumably gain some satisfaction from doing so. They are moved by a desire for pleasure, even if it lasts only the three or four minutes that their cigarette does.

Nor can we refute egoism by pointing to examples of people accepting extreme pain—say, the sort that comes from a root canal. When people sit still in a dentist's chair, they do so with their future in mind. They want to prevent something really bad from happening to them down the road—gum disease, rotting teeth, and so on. It's hard to imagine why people would accept such pain if they thought there was nothing to be gained by it.

So the egoist's claim must be understood as follows: All human actions are aimed at avoiding some personal loss or gaining some personal benefit (or both), either in the short run or in the long term (or both).

Many actions fail to achieve any of these aims. This doesn't undermine egoism, though, since the theory is not about the results of our actions but about their motivations. An action can be done with the thought that it will gain you millions, even if it leaves you in debtor's prison. Such a case is no threat to psychological egoism.

It is true that certain kinds of behavior, such as sneezing or snoring, are not done from self-interest. Egoists can handle this sort of case as well. The egoist thesis is one about actions that result from a person's intention to do something. Suppose that an epileptic suffers a seizure. Her arm shoots out and hits someone. The egoist needn't say that she was somehow trying to benefit herself. She wasn't intending to do anything at all. In order to refute psychological egoism, you must provide examples in which a person intends to do something, even though she wasn't trying to benefit herself.

Does It Matter whether Psychological Egoism Is True?

There are three popular arguments designed to show that no such example can be provided. But before we consider those arguments, we need to ask a preliminary question. Since psychological egoism is not an ethical theory, what bearing could it have on our ethical concerns?

As it happens, quite a bit. The Implications of Egoism Argument spells this out pretty clearly:

1. If psychological egoism is true, then we can't be altruistic.
2. If we can't be altruistic, then it can't be our duty to be altruistic.
3. Therefore, if psychological egoism is true, then it can't be our duty to be altruistic.
4. Psychological egoism is true.
5. Therefore, it can't be our duty to be altruistic.

Premise 1 is true by definition. No matter whether you like or hate psychological egoism, you should accept this premise. Premise 2 is also very plausible. If we can't be altruistic, then it can't be our duty to be altruistic. Why? Because we are not required to do the impossible—morality might be pretty demanding at times, but it can't be that demanding. The initial conclusion, 3, follows logically from 1 and 2, so if they are true, as they certainly seem to be, then 3 must be true as well.

That leaves only premise 4, which asserts the truth of psychological egoism. Suppose that it is true, and that altruism is a myth. Then we have no duty to be compassionate, considerate, kind, or generous. We would have to radically change our moral ideals, ridding them of altruistic elements. The resulting morality would be largely unrecognizable. Most of what we take for granted about the ethical life would turn out to be mistaken.

It may sound overdramatic to put it this way, but the fate of morality as we know it depends on whether psychological egoism is true. Let's see whether it is.

The Argument from Our Strongest Desires

There are three central arguments that seek to establish the truth of psychological egoism. The first of them is the Argument from Our Strongest Desires. The argument begins by claiming that every action you perform is based on your strongest desire. But if your strongest desires are what's
moving you, then you are pursuing self-interest. So, whenever you act, you are pursuing self-interest. That is just what the psychological egoist claims:

1. Whenever you do something, you are motivated by your strongest desire.
2. Whenever you are motivated by your strongest desire, you are pursuing your self-interest.
3. Therefore, whenever you do something, you are pursuing your self-interest.

Consider the argument's initial claim: our actions are always caused by our strongest desires. Apparent counterexamples spring to mind: visiting a nagging relative, enduring a tedious commute, handing over your wallet to a gunman. Does anyone really want to do these things? Probably not. But that doesn't show that this first premise is false. We can explain such actions by pointing to other things that people want—to sustain family harmony, to keep one's job, to stay alive.

The case of strictly conscientious action is more difficult for the egoist to handle. Such action occurs when you do what you think is required of you, even in the face of great temptation. Your desires all push one way, and duty calls in another. People sometimes follow the latter path.

Of course, we could say that even here, people are acting on their strongest desire. It's just that in cases where people knuckle down and resist temptation, their strongest desire is to do their duty.

This move could save premise 1. But that should be cold comfort to egoists, for if they relied on this move, then they would have to admit that premise 2 is false. They would have to say that our deepest desire is not always to benefit ourselves. Sometimes we most want to do our duty, even when it comes at a personal cost.

When we put it this way, it becomes clear that egoists must deny the existence of strictly conscientious action. Of course, people do help others, and people sometimes speak of themselves as acting just for the sake of duty. But egoists do not take such talk at face value. They insist that those who help others, despite what they might say, are really just looking out for themselves. People sometimes lie to others to impress them. And people sometimes lie to themselves, deceiving themselves with self-flattery.

These points are undeniable, but they fail to show that conscientious action never occurs. We can all think of apparent cases of such action, and even if some of the evidence is tainted by lies and self-deception, we have no reason (as yet) to think that all of it is suspect. Until we are given such a reason, the case of conscientious action presents a real problem for the egoist's argument.

There is another way to put this worry. Let us grant for the moment that premise 1 of the argument is true. So we always do what we most want to do. But that doesn't yet show that our strongest desires are always for personal gain. That is precisely what has to be proven.

Have a look at premise 2 again. It states that our strongest desires are always for our own personal gain. But those who believe in altruism will not accept that. Indeed, if we sign on to premise 1, then premise 2 begs the question—it assumes the truth of the conclusion that it is meant to support. It is preaching to the converted. It is not a neutral thesis that can appeal to both fans and opponents of psychological egoism. Only those who already reject the existence of altruism will accept it. Everyone else will think that our strongest desires may sometimes be for something other than self-interest. We therefore cannot accept premise 2 without a lot more argument.

Premise 2 assumes that just because a desire is mine, it must have a certain object—me, and my self-interest. But whose desire it is, and what the desire is for—these seem to be completely separate issues. Since we are assuming now that premise 1 is true, we can say that whenever I act, I do so from my strongest desire. But that does not settle the question of what my desire is for. The egoist says that just because a desire is mine, then it has to be aimed at my self-interest. But why couldn't it be aimed at your welfare? Or the well-being of a friend, or my country, or even a stranger?

The egoist might respond: if you are doing what you really want, aren't you thereby self-interested? It is important to see that the answer may well be no. For all we know, some of us deeply want to help other people. When we manage to offer such help, we are doing what we really want to do. Yet what we really want to do is to benefit someone else, not ourselves.

Now, if people get what they really want, they may be better off as a result. (But they might not: think of the anorexic or the drug addict. Or think of the cases of disappointment discussed in chapter 4.) Yet the fact that a person gains from her action does not prove that her motives were egoistic. The person who really wants to help the homeless, and volunteers at a soup kitchen or shelter, may certainly derive pleasure from her efforts. But this doesn't show that pleasure was her aim. Her aim may have been to help those in need. And because her aim was achieved, she thereby received pleasure.

As a general matter, when you discover that your deepest desires have been satisfied, you often feel quite pleased. But that does not mean that
your ultimate aim is to get such pleasure. That's what needs to be shown; we can't just assume it in trying to figure out whether our motives are always self-interested.

In short, even if this argument's first premise is true, its second premise begs the question. We don't yet have reason to doubt the possibility of altruistic motivation.

The Argument from Expected Benefit

So let us consider another argument, the Argument from Expected Benefit. This argument claims that people always expect their actions to leave them at least a bit better off. And if they do, then their constant aim is to gain from their actions. So whenever people act, they are trying to get some personal benefit. That is just what psychological egoism predicts:

1. Whenever you do something, you expect to be better off as a result.
2. If you expect to be better off as a result of your actions, then you are aiming to promote your self-interest.
3. Therefore, whenever you do something, you are aiming to promote your self-interest.

I have my doubts about this argument. Premise 1 seems to ignore the existence of pessimists. And even optimists sometimes expect to suffer for their actions. Consider a person who thinks she can get away with a convenient lie, but admits the truth anyway, knowing the misery that's in store for her as a result. Or imagine an employee late for an important appointment who increases his delay by helping a stranger cross a dangerous street. He doesn't anticipate any reward for his good deed, and knows that this delay is only going to stoke his boss's anger. Both cases seem to be counterexamples to the claim that our actions are always accompanied by an expectation of personal benefit.

These examples, and the many others like them that we could imagine, are bound to be controversial. Egoists may insist that people always do expect to gain from their actions, even if it sometimes appears that they don't. After all, appearances can be misleading. It may look as if we sometimes expect only the worst. But deep down, we may always believe that our actions will make us better off.

I am not convinced, but for now, let's assume that my doubts are mistaken and that premise 1 is secure. Even so, the second premise—the one that says that if you expect a benefit, then that is your aim—is very implausible.

The problem is that it looks like the egoist is begging the question again. Return to those who enjoy volunteer work. Such people may well expect to gain something from their activities. Volunteers often report feelings of deep satisfaction at their efforts. But this doesn't show that their motives are self-interested. A volunteer, with all sincerity, may claim that her aim is to help others, rather than to help herself. The enjoyment she experiences from her volunteer activities is nice, no question about it. But it is a side effect, a foreseen benefit, and not the motive of her actions.

Again, the egoist will insist that we can't be sure of her sincerity. And even if she is sincere, she may not realize the true motives that get her to the shelter every week. She may just be looking for the approval of her fellow volunteers, or for her efforts to be publicized in a way that will boost her career. We can't be sure that this isn't what's going on.

That is true: We can never be absolutely certain of our own motives, much less those of others. But that is not enough to show that the egoist is correct. Her claim—that whenever we expect some benefit, our aim is to get it—is controversial. It seems that there are counterexamples, though we can't be sure there really are. Given evidence that appears to undermine premise 2, the egoist needs to defend it.

And a defense is not far to seek. The best way to support this premise is by citing a more general principle that supports it. And this is the natural candidate:

\((G)\) Whenever you expect your action to result in \(X\), then your aim is to get \(X\).

If \((G)\) is true, then whenever I expect to get money, glory, or approval from my actions, that is my aim. Generally, if I expect some personal gain, then my goal is to obtain it. That is just what the argument's second premise says.

The problem is that \((G)\) is false. Whenever I lecture to a large audience, I expect some people to fall asleep. Believe me, that is not my goal. If I ever had the chance to play against a professional tennis player, I'd expect to lose. But it wouldn't be my aim to do so. My goal would be to enjoy the experience, and to learn a thing or two. If a student fails to prepare for an exam, she may expect to receive a poor grade. It hardly follows that she is trying for one.

So expecting something doesn't always mean aiming for it. And that poses a direct challenge to premise 2 of the Argument from Expected Benefit. It might be true, but we have seen no good reason to think so. Indeed, the best reason to accept premise 2—namely, principle \((G)\)—is false. If we
are to have any confidence in this argument, the egoist needs to furnish us with much better support for both of its premises.

The Argument from Avoiding Misery

Still, many people feel the force of the egoist's assertion: if an action promised only misery, then we wouldn't do it. Thus our actions are always prompted by a desire to avoid such misery. This is a self-interested motive. Therefore, all of our actions are prompted by self-interest.

This is a variant on the previous argument, but it has been very influential in convincing people to adopt psychological egoism, so it is worth spending a little time with it. We can reconstruct the Argument from Avoiding Misery as follows:

1. If we would never do an action that promised only personal misery, then all of our actions are done in an effort to avoid such misery.
2. We would never do an action that promised only personal misery.
3. Therefore, all of our actions are done in an effort to avoid personal misery—and that is a self-interested motivation.

Premise 2—the claim that we'd never act in ways that promised only misery—may well be false. Consider a gymnast who gives up a place on her country's Olympic team to allow a fellow athlete the coveted spot. Or a prisoner of conscience who stands by her principles, knowing that she is going to be tortured as a result. Or a killer who wants only to suffer, in order to repent for his crimes.

Egoists will try to point to benefits that each sacrifice is expected to bring. Perhaps they will always succeed. But even if they do, that wouldn't show that egoism is true.

That's because premise 1 is highly suspect. It is supported by this principle:

(P) If I would never do an action that promised me only X, then I am always trying to avoid X.

The egoist says that we wouldn't do actions that promised only misery; therefore, we are always trying to avoid misery. And avoiding misery is self-interested; therefore, we are always motivated by self-interest.

But there are many counterexamples to (P). I wouldn't do an action if it guaranteed me only a thousand bee stings, or permanent bankruptcy. That doesn't mean that I am always trying to avoid these things. I wouldn't do an action if the only possible outcome were a lifetime supply of hard-boiled eggs and marshmallows. (I hate these things.) That hardly means that my every action is aimed at avoiding them. Perhaps it's also true that I'd never do an action that promised me only certain death. But that doesn't mean that my main motive in reading philosophy or watching Arrested Development is to avoid dying. Thus even if we wouldn't do an action if it promised only misery, it just doesn't follow that our motivations are always to avoid such misery.

And so even if you don't like my earlier counterexamples to premise 2, the problems with premise 1 threaten the entire argument. If we are to accept the argument's conclusion, both premises must be credible. At this point, we have good reason to doubt each of them. Without further defense, we should withhold our support from the Argument from Avoiding Misery.

Two Egoistic Strategies

Things aren't looking that promising for egoists. But there are still two strategies that they can use to try to show that the evidence of altruism is overrated.

Appealing to the Guilty Conscience

Consider people who have taken great risks to oppose oppressive regimes. Many of these people claim that their conscience wouldn't let them do otherwise—had they taken the safe path, they wouldn't be able to live with themselves. In their eyes, to give in to evil is to tarnish oneself. Many people speak of the terrible guilt they'd feel if they did nothing to fight against injustice.

Egoists insist that even these people are wholly self-interested. They are opposing injustice in order to make sure that they can sleep well at night, that they can be free of crippling guilt. Having a clean conscience is a benefit. And so such people are acting from self-interested motives.

It is important to see why this sort of reasoning does not work. If a person is truly good, she will certainly be troubled at the thought of doing wrong. But that does not prove that her actions are motivated by a desire for a guilt-free conscience. Indeed, if she did not care about others, then she wouldn't lose a wink of sleep at the thought of their misery. Those who suffer pangs of guilt from having harmed others, or having missed a chance to help them, are precisely those who care about other people.
There is a basic difference between those who are deeply upset over the damage they cause and those who aren't. It is reported that Eichmann slept like a baby, despite having engineered the deaths of hundreds of thousands in the concentration camps. And we all know others who are beside themselves at the very thought of having done a serious wrong. Egoists lump both kinds of people together and, in doing so, fail to appreciate that those who are subject to guilt must have altruistic concerns. If they didn't, then they wouldn't feel so bad when failing to help others in need.

Expanding the Realm of Self-Interest

Consider the mother who gives away the last of her food to save her only child. This seems like the essence of altruism. And yet the egoist might say that the mother is really looking out for herself, by trying to avoid a terrible personal loss, for she would be devastated at witnessing the death of her child. Further, since the mother cares deeply about her child, her well-being rests in large part on how well her child is faring. By helping her child, the mother is thereby helping herself.

Much of what was just said is true. But this cannot be good news for the egoist, since the details of this little story imply that egoism is false. For most parents, their own well-being crucially depends on that of their children. And so, when parents tend to the needs of their children, they are usually helping themselves in the bargain. But this doesn't show that parents are motivated by self-interest when they offer such help. As we've seen, even if people expect to gain by helping others, that doesn't prove that their aim is to acquire such benefit. Further, if a parent suffers at the thought of her child's misery, then that is evidence of altruism, not egoism. Those who care only for themselves do not suffer when thinking of the misery of others.

The second egoist strategy is thus confused. When we present difficult cases for egoism—that of Ross McGinnis smothering a live grenade in his Humvee, or that of a mother giving her last bit of nourishment to her child—the egoist cannot sensibly reply that such people are motivated only by self-interest. For such people, what really matters is living honorably, or seeing their children flourish. Their concerns are directed at something other than their own gain. That is not something that the egoist can make sense of.

Letting the Evidence Decide

People often benefit one another. Just think of the good that aid workers, nurses, teachers, and parents do. Sometimes their motives are clearly self-interested. But not always. In many cases, people report that their primary motivation is to help someone else, even when such action is known to come at a personal cost. As we have seen, the egoist must view all such reports as misleading, based on either self-deception or the intended deception of others.

This puts the egoist's thesis in jeopardy. We can see the danger by constructing a dilemma: either we do or we don't allow the evidence to settle the question of whether altruism exists. There is trouble either way.

To appreciate the difficulties, consider this cautionary tale. As I write this, my hair, once dark black, now has a substantial amount of gray in it. Suppose a friend of mine starts teasing me about this. I tell him that I can't help it. "Yes, you can," he replies. "Grecian Formula will do the trick." "Oh, I doubt that," I say. "Those elves won't let anything stand in their way."

What elves? Why, the invisible ones. The ones who have turned my black hair gray. Each night they cover a strand or two with permanent gray paint, and over time, I've become more gray than black. And worse, there's nothing I can do about it, since I can't catch them and put a stop to the madness. After all, they are invisible. And very clever.

My friend, who thought I was joking, now becomes alarmed. "You know, don't you, that invisible elves don't exist. And hair color is a matter of genetics." He tracks down the latest data to make his point. Naturally, I dismiss this as the product of a conspiracy planted by the geneticists. No matter what sort of evidence my friend provides, I stick to my guns—it's the elves who are behind it all.

This unshakable conviction is not the mark of a rational mind, but rather the crazy faith of someone seriously out of touch with reality. In refusing to allow that I may be mistaken, I am being stubborn and dogmatic. If the evidence fails to support my beliefs, then I fault the evidence, rather than change my beliefs.

Some people are utterly convinced that the earth is flat; others, that space aliens built the Egyptian pyramids; yet others, that George W Bush ordered the destruction of the World Trade Center. Many of these people feel certain of their views. No amount of evidence is going to get them to change their mind.

But these beliefs, like mine in the invisible elves, are not rational. They are not supported by the evidence. And the worry is that a belief in psychological egoism is no better than the ones I've just described. If psychological egoists stubbornly deny all contrary evidence, and routinely dismiss the many cases of apparent altruism, then their view is similar to the invisible
elf hypothesis. If I refuse in advance to allow the chance that my pet theory is mistaken, and refuse even to admit the possibility that evidence might cast doubt on it, then I am irrationally clinging to a prejudice.

For all I have said, psychological egoism may yet be true. And invisible elves may really exist. But it wouldn’t be rational to think so.

So let us opt for the other half of the dilemma. We should keep an open mind and let the evidence decide whether altruism exists. But if we go this route, and subject psychological egoism to serious testing, then egoism fails the relevant tests.

Egoism is a theory about human motivation. And there are two sorts of evidence we can rely on when it comes to determining people's motives: testimony and behavior. People can tell us what moves them, and we can see for ourselves how they behave. Neither kind of evidence is perfect. We can misinterpret behavior. And, as we've already seen, people can be deceptive about their true motives. Still, testimony and behavior are the only sources of evidence we have. And they both point strongly to the existence of altruism. To discredit all such testimony, and to reinterpret all such behavior, is to render egoism as unreasonable as my invisible elf hypothesis. If we are prepared to let evidence decide the matter, we must decide that psychological egoism is false.

Conclusion

The truth of psychological egoism would spell the defeat of morality as we know it. If altruism is impossible, then morality cannot reasonably ask us to sacrifice self-interest for the sake of others. The central moral virtues of benevolence, kindness, and compassion would have no place in morality. If all we can do is look out for Number One, then there is little point in demanding that we do otherwise.

So the stakes are high. And psychological egoism can seem the only clear-eyed, unsentimental view of human nature. We're all familiar with cases in which we gave ourselves credit for being altruistic, only to realize, later on, that we were really just looking out for ourselves.

But when we examine the arguments and evidence, there is reason to take a more charitable view. Few of us are saints. But few of us are wholly self-absorbed, either. And this opens up the possibility that we may become better than we are, more altruistic and more generous, shifting our attention away from our own needs and onto the needs of others.

A plausible philosophical principle, first offered by Aristotle, is instructive in this context. The principle tells us to follow the appearances. It directs us to think that things are really as they seem, that appearances match reality—until we have excellent reason for doubt. It seems that there is plenty of altruistic motivation. People often speak of how much they care about others. And there are many cases in which people have actually offered help to others, strangers and loved ones alike. All of this evidence might be highly misleading. But the arguments that egoists provide, and the strategies they offer to handle counterexamples, are unconvincing. They fail to give us excellent reason to doubt the appearances of altruism. Until better arguments and strategies come along, we should trust the appearances and regard psychological egoism with great suspicion.

Discussion Questions

1. Psychological egoism is not an ethical theory, but a descriptive view about human behavior. Given this, how might the truth of psychological egoism have implications for ethics?
2. How do psychological egoists explain extreme acts of self-sacrifice, such as falling on a grenade for one’s fellow soldiers? Do you find their explanation of such phenomena compelling?
3. Many people think that whenever people act voluntarily, they are acting on the basis of their desires. If this is true, does this mean that all voluntary action is self-interested?
4. Is there any possible observation that could disprove psychological egoism? If so, what would it be? If not, is this a good or a bad feature of the theory?
5. All things considered, do you agree with the psychological egoist’s claim that all human behavior is fundamentally self-interested? Defend your answer.
Psychological egoism is a theory about human motivation: it tells us that our only motivation is to make ourselves better off. This is not an ethical view, because it says nothing about what is right or wrong.

But as we have seen, if psychological egoism is true, then there is little point in fashioning a morality that demands self-sacrifice. Morality does not demand the impossible. If psychological egoism were true, then all morality could possibly do is to ask that we look out for ourselves. This is precisely the advice of ethical egoism.

Unlike the psychological version, ethical egoism really is a moral theory. It tells us about what we are morally required and forbidden to do. Specifically, it says that there is one ultimate moral duty—to improve your own well-being as best you can. Whenever you fail to achieve this goal, you are behaving immorally.

Many ethical egoists have been psychological egoists as well. But this isn't required. You might reject psychological egoism, and so think that we can be altruistic, while denying that we should be directly concerned with the well-being of others. Ethical egoism gains strength from psychological egoism, but this is not its only source of support. As we will see, there are several arguments for thinking that (surprisingly) ethics is all about getting ahead in the world and making ourselves as well-off as we can be.

Why Be Moral?

Imagine that you are a stock broker with inside information about an upcoming corporate takeover. Once the takeover is announced, the company's stock will soar. If you were to purchase a large amount of that stock right now, you'd stand to make millions. Should you do it?

Suppose that you are seriously thinking about this. You've carefully calculated the chances of getting caught, and have determined that the risk is small. Further, even if you are caught, the penalty is slight enough as to make the risk worth taking. Still, you are sure that such behavior is immoral. Brokers are able to gain privileged information only on the condition that they not take unfair advantage of it. You'd be doing just that. Yet since the potential gain is so great, why let morality stand in the way?

There are countless situations that pose the same problem. Imagine cheating on an exam to increase the chances of landing an excellent job. Or lying to an investigator to avoid prosecution. Or doing some creative bookkeeping to minimize a tax burden. Or spreading nasty rumors in order to hurt a competitor.

In a perfect world, virtue would always be rewarded and vice would never flourish. But what should we do, here in our imperfect world, when immorality promises great rewards? What to do when moral behavior is met with ridicule, a prison term, or a bullet? It is easy when morality and self-interest give the same advice. But what if they don't?

If ethical egoism is true, there are no such cases. This sort of egoism claims that actions are morally right just because they best promote one's self-interest. On this view, conflicts between self-interest and morality are impossible, because our fundamental moral duty is to maximize self-interest. If, among all of the options available to you, there is one that will serve you best, then that is the option that morality requires.

It may seem that there is nothing "ethical" at all about such a theory. Consider this: if people can best improve their lot in life by secretly killing political opponents, stealing from the weak, or humiliating their employees, then ethical egoism imposes a moral duty to do such things. But how could a plausible ethical theory do that?

Indeed, it seems that we can use such examples to create a decisive anti-egoist argument—call it the Argument from Paradigm Cases:

1. If an ethical theory requires killing, rape, or theft, just because such actions promote self-interest, then that theory cannot be true.
2. Ethical egoism sometimes requires such things, just because they sometimes do promote self-interest.
3. Therefore, ethical egoism cannot be true.
A paradigm is a model, a very clear example. Some of the examples used in this argument are the clearest cases of immorality we can think of. The underlying thought here is that any ethical theory ought to classify these actions as immoral, and explain why they are so obviously wrong. Ethical egoism fails to do that.

Ethical egoists (henceforth, just egoists) can offer two replies to this argument. They can reject its first premise. Or they can reject the second.

To reject the second premise, egoists must claim that killers, rapists, and thieves never benefit from their crimes. This claim could be true if there is a God who punishes these actions with eternal damnation. It could also be true if such acts deserve suffering, and a doctrine of karma guaranteed that you eventually get what you deserve. But suppose that you don't find such accounts convincing. Are there other ways to defend the idea that those who kill, rape, and steal are never better off as a result?

Plato thought he could do it. He tried to show that those who are unjust are always harmed because of their injustice. He spent a good part of the Republic arguing that all-powerful tyrants, though able to control and acquire so much in this world, are still doomed to terrible lives. Even as they tell themselves how much fun they are having, they are inwardly miserable, constantly fearful and insecure, leading lives filled with anxiety and suspicion. Once we see what an immoral life is really like, we will realize that we are far better off being moral.

Plato's argument depends heavily on his claims about the inner lives of immoral people. I think it fair to say that his case is not fully persuasive. Certainly, many immoral people are deeply troubled and unhappy. But others are able to sleep well at night, take pride in a job well done (assassination, theft, betrayal), and find friends within a network of like-minded associates. The bad guys sometimes get away with it, have a lot of fun in the meantime, and never regret the harm they have caused.

Much more, of course, needs to be said about what is truly beneficial for us. Chapters 1–4 cover these issues, but they are hardly the final word on the matter. And since we don't have space here to discuss religious views of the afterlife, we have to admit that the jury is still out on the truth of premise 2. Perhaps it is false—perhaps there is some very powerful argument that can show that bad people never profit from their wrongdoing. If that argument can be given, then we can strike down premise 2. And that, of course, would be great news for the egoist, since the fall of premise 2 would spell the defeat of the entire Argument from Paradigm Cases.

But let's assume for the moment that premise 2 is true, and that, as it seems, some cases of immorality really do benefit those who commit them. If that is so, then egoists must take aim at premise 1 of the argument. And that, in fact, is precisely what they will do.

Suppose that we will not always do best for ourselves by following the familiar laundry list of moral rules. Then conventional morality and self-interest will sometimes clash. When that is so, the egoist is forced to reject conventional morality. And since the first premise of the argument is just an expression of conventional morality, the argument begs the question against the egoist.

Think about it this way. Only those who already dislike egoism would accept the first premise. Premise 1 is not a neutral claim. Rather, it assumes that egoism is mistaken. It assumes, specifically, that self-interest cannot morally justify actions such as rape and theft. True, such actions do seem to be paradigm cases of immorality, and so any moral theory that encouraged such actions would be suspect. But an egoist who accepts premise 2 will claim that our paradigms are mistaken. And they might be. We can't absolutely rule out such a possibility.

Still, we can recall Aristotle's advice, recorded at the end of the previous chapter. We have reason to stick with the appearances, and to take things at face value, until we are given excellent reason for doubt. It seems that killing, rape, and theft are very clear cases of immorality, especially when they are done to serve self-interest. That is just what premise 1 says. Given how appealing that premise is, we are right to insist that egoists provide a compelling counterargument, one that can reveal the error of our popular ways of thinking. Let's now consider two prominent attempts to do just that.

Two Popular Arguments for Ethical Egoism

As we have just seen, ethical egoism can clash very radically with our deepest moral beliefs. This happens in three ways.

First, egoism may require some actions that seem highly immoral. If promoting self-interest requires a knifing in the back, the betrayal of a friendship, or the illegal use of insider information, egoism insists that we do these things.

Second, egoism forbids us from doing some actions that seem clearly morally good. Egoists think that any action that involves a genuine self-sacrifice is immoral. Egoism insists that it is wrong to go out of your way
to be kind, to keep your promises, or care for your children, if you pass up a chance at personal gain by doing so.

Third, egoism permits us to escape some very important moral duties. It seems, for instance, that we each have a duty of easy rescue. If saving someone comes at little or no cost to ourselves, then we must do what we can to help. Yet if your interests are best served by ignoring such victims, then egoism frees you of any duty to help. Indeed, as a general matter, egoism requires that we help others only when we help ourselves in the bargain.

The Self-Reliance Argument

These claims require defense. Here is one that is worth considering—not because it succeeds, but because it is often urged with approval. Call it the Self-Reliance Argument:

1. If everyone were to mind his own business, and tend only to his own needs, then everyone would be better off.
2. We ought to do what will make everyone better off.
3. Therefore, we each ought to mind our own business and tend only to our own needs.

There are two problems with this argument. Its first premise is false. And its second premise is one that egoists cannot accept.

The first premise is false, because those who are in need of help would not be better off if others were to neglect them. If you are suffering a heart attack and I know CPR and am the only one able to help, then you are definitely worse off, not better, if I decide to leave you alone and go on my way.

Nor is complete self-reliance even a good general policy. It may be better if everyone were self-reliant than if everyone were constantly sticking their nose into other people's business. But these are surely not our only two options. There is a middle path that allows a lot of room for self-interest but also demands a degree of self-sacrifice, especially when we can offer great help to others at very little cost to ourselves. Everyone would be better off if people helped others to some extent, rather than if people offered help only when doing so served self-interest.

Further, the argument's emphasis (in premise 2) on our doing what will improve everyone's well-being is not something that the egoist can accept. For ethical egoists, the ultimate moral duty is to maximize personal benefit. There is no moral requirement to make everyone better off.

The Libertarian Argument

There is another popular argument for severely limiting our duties to others. Call this the Libertarian Argument. Libertarians claim that our moral duties have only two sources: consent and reparation. In other words, any duty we have to another person stems either from our voluntarily agreeing to accept that duty (i.e., our consent), or from our having violated someone's rights, and so owing a duty to repair the wrong we have done. But if I do not consent to help other people, and have done them no wrong, then I have no duty to help them.

This is a fascinating argument. There is little controversy that our duties can originate as the libertarian suggests. The real question is whether there are sources of duties other than consent and reparation. In the example of offering easy rescue, for instance, it seems that the victim's needs, together with my ability to help at little cost, are enough to generate a duty that I help. Consent did not enter the picture—I was morally required to help even if I didn't agree to do so. And I had done the victim no wrong, so reparation was not an issue. The libertarian will deny that someone else's needs, plus one's own ability to help, are enough to generate a moral duty of offering assistance. After all, if I need $10,000 for knee surgery, and you are a millionaire who could easily afford to pay for it, you are not automatically required to hand me the money.

There is a lot one might say about the Libertarian Argument. Indeed, I think that it poses one of the most fundamental challenges in political philosophy. Yet we can avoid a look into its details, because even if the argument is sound, it cannot support ethical egoism.

The basic explanation for this is that egoists cannot accept the argument's central claim. Egoists deny that there are two ultimate sources of moral duty (consent and reparation). In fact, egoists deny that either of these is a source of moral duty. For them, self-interest is the only source of our moral duties. We must fulfill our voluntary agreements, or repair the damage we've done, only when doing so is in our best interest. When it is not, we have no moral duty.

The Libertarian Argument tells us, for instance, that if we promise to volunteer at a local hospital, or consent to the details of a home sale, then we should follow through. However, if doing so fails to make us better
off, then egoism says that we have no duty to stick to our agreements. Indeed, egoism forbids us from holding up our end of the deal. Libertarians would require that we keep our word. Since egoism and libertarianism often give such conflicting advice, egoism cannot gain support from libertarianism.

The Best Argument for Ethical Egoism

Despite their popularity, the Self-Reliance and the Libertarian arguments fail to support ethical egoism. To locate a stronger foundation for the view, I think we need to focus on one of the perennial questions in ethics, and see how well the egoist can answer it. It is here that egoism finds its strongest support.

The perennial question is the one we began with: why be moral? Ethical egoism has a watertight answer to this question. We should always be moral because morality always serves self-interest. We all agree that there is good reason to look after ourselves. Since that is so, and since morality (as the egoist sees it) always advises us to protect our interests, there is always good reason to do as morality requires.

The argument is logically valid. Its two premises are each widely accepted. And on the face of it, they are each highly plausible. Consider the first premise. If I am duty-bound to do something, don't I have some good reason to follow through? Perhaps this good reason isn't always decisive—there might sometimes be even better reasons that count against doing my duty. But at the very least, being morally required to (say) keep a promise, or tell the truth, is at least some reason to do such things.

Now consider the second premise. It is hard to doubt that there are compelling reasons to protect your own interests. If some action promises me no gain, but only loss, then what reason is there for me to do it? I'd be irrational to sacrifice my interests without the promise of some compensating benefit. It might be heroic to give up one's life for a stranger or to forfeit one's last chance at happiness so that others may enjoy life. But reason can't require such sacrifice.

My own view is that the best argument for ethical egoism is ultimately unpersuasive. I think that the first premise is true, but have come to doubt the second premise. Once we examine this theory of reasons with a little more care, it may be less plausible than a first look would suggest.

We can begin to see this by considering two superficially similar claims:

(A) If an action makes you better off, then there is good reason for you to do it.

(B) If there is good reason for you to do an action, then doing it must make you better off.

Claim (A) looks pretty good. It tells us that self-interest is always a good reason for doing something. It doesn't say that this is the only reason for acting. And it doesn't say that it is always the best reason.

Though (A) is an extremely attractive claim, it is difficult to explain its plausibility. It seems to me just one of those rock-bottom assumptions we make about the kinds of reasons we have. If someone were to deny it, for instance, it isn't clear what we could say on its behalf. That doesn't show it to be implausible. Not everything can be explained. It may be that (A) is more basic than any other claim we might use to defend it.

This isn't the case for (B), which should look familiar. It is the same claim as the Best Argument's premise 2. And it seems that there are many counterexamples to it. Cases of easy rescue provide the most compelling ones. If I see a terrible traffic accident occur, and have a cell phone with me, I have a reason to dial 911. I have that reason even if making the call will gain me nothing. If I see a window washer high up on a ladder and notice that my walking companion is about to accidentally bump into it, I
have a reason to warn my friend and make sure that she avoids the ladder. I have that reason even if there is no benefit to me of doing so.

Defenders of premise 2 cannot accept this, and that seems a strike against their view. We can allow that promoting self-interest is a good reason for doing things. But why, as they claim, is it the only good reason? I don't know of any compelling answer to this question.

In the absence of such an answer, we have some basis for thinking that premise 2 is false. And if it is false, then the Best Argument for Ethical Egoism is unsound, since that argument relies on it. This does not by itself show that ethical egoism is false. But if we can combine the absence of a strong argument for ethical egoism with the presence of strong reasons to oppose it, then this does leave us with a powerful case against ethical egoism.

Three Problems for Ethical Egoism

The three most serious problems for ethical egoism are (1) that it violates some of the deepest and most central moral beliefs we have; (2) that it cannot allow for the existence of moral rights; and (3) that it arbitrarily assigns self-interest complete priority over the interests of others.

Egoism Violates Core Moral Beliefs

We have already mentioned the first criticism, and have allowed that it can't refute egoism all by itself. Still, if a theory deeply violates common sense, and if there is no compelling argument for that theory, then we are justified in rejecting it. Egoism does run strongly counter to common sense, since it imposes a moral duty to kill, rape, torture, or humiliate whenever doing so best serves self-interest. It allows us to ignore the vital interests of others, even if we can promote them at no cost to ourselves. And we have not seen a compelling argument for ethical egoism. Until we do, we are therefore right to trust our core moral beliefs, and so reject egoism.

Egoism Cannot Allow for the Existence of Moral Rights

It isn't clear that egoism can make sense of moral rights. These are moral claims that give a person control over certain aspects of her life, even if it is to another person's advantage to ignore such moral claims. If I have a right to be free of physical attack, for instance, then it is wrong of anyone else to beat me to a pulp, even if doing so somehow makes them better off. Egoists can offer no one a guarantee against this (or any other) sort of personal violation.

Suppose that it is in your best interest to kill me, or to deny me freedom of speech, or to take what I own. If egoism is true, then you are morally permitted—indeed, morally required—to do these things. And if you are morally allowed to do them, then it is hard to see how I could have a right that you not do such things. My right to life or to free speech is worthless if other people are allowed to kill me or shut me up whenever it serves their interests to do so.

Egoists can reply that they grant each person the right to pursue self-interest. This is true, in a way. But not in a way that offers us any protection. To see this, consider two things we might mean when we say that everyone has a right to pursue self-interest:

(A) All people are allowed to pursue self-interest.
(B) Each person is entitled to a certain amount of freedom from hostile behavior by others, and this means that everyone else has a duty not to interfere with a person's pursuit of self-interest.

Egoists accept (A). They can't accept (B). Yet (B) is the only version that offers us protection against the actions of others.

(A) is toothless. To see this, imagine a plot device that became familiar to me as a child. A surprising number of 1970s TV episodes imagined a warped villain who had some hapless victim at his mercy. The villain says to him, "You are perfectly free to run. I'm not stopping you. So run!" The victim is allowed to run. In this sense, he has a right to flee. But there is a catch. The villain is also allowed to hunt his victim and kill him if he can. The victim's right to run is basically worthless in such a situation. It offers him no protection at all.

Now, back in the real world, suppose (as is often true) that your self-interest conflicts with mine. If egoism is true, then I have a duty to harm you, since that will benefit me. And you have a duty to harm me for the same reason. Even though we are each allowed to pursue our self-interest, egoism can't forbid other people from harming us if it is in their interest to do so. It grants us a right of the sort described in (A). But that offers us no moral protection against interference from others. And such interference can be very terrible. It can even amount to killing, if killing is what would maximize someone else's interests.

If egoism is correct, then our basic moral duty is to make ourselves as well-off as possible. We may have to hurt others in order to fulfill that duty. And that means that morality will not protect them from such harm. Nor will it protect us, if the tables are turned. So the best that egoism can do
here is to tell us that we are each free to pursue self-interest. It cannot offer us the sort of moral rights we really want—those that protect us from harm, and from unwanted interference by others.

Egoism Arbitrarily Makes My Interests All-Important

Now we arrive at the deepest threat to ethical egoism. This theory tells us that we should give complete priority to the interests of a single person (oneself) over the interests of everyone else. If that were really so, then there would have to be some relevant difference that could justify this different treatment. But what could that be? My basic needs—for food, shelter, physical security, good health, and so on—are shared by nearly every human being. I am unique, of course, but then so is everyone else. I have my special talents, but again, so does everyone else.

Ethical egoists need to explain why we are allowed to entirely discount the basic needs of others, even though these needs may be identical to our own. I think that egoists can, in fact, make a partial reply here.

Suppose that my leg has been wounded in a hunting accident. I can still drive to the hospital and get it cared for. I know that doing so is going to cost me almost all of the money I have. Once I arrive at the hospital, I see another victim of a hunting accident, with an injury very like my own. He is obviously poor, needs the surgery as badly as I do, but lacks the money to pay for it. Most of us agree that it would be acceptable if I used my money to pay for my own surgery, rather than forgo it and pay for his. But why?

To make the case harder, assume that this other accident victim is as nice a guy as I am, is just as smart and community-minded as I am, and so on. Still, I am allowed to give myself preferential treatment here. Our cases appear alike, and yet common sense allows me to give myself priority over another person who is my equal in every relevant respect.

Perhaps common sense is just mistaken in allowing people to give some priority to their own needs over those of others. If it is, then ethical egoism is certainly false. But suppose that common sense has it right, so that in the hunting example, for instance, I am allowed to spend the money on myself, rather than on a stranger. If so, then morality does grant individuals some extra consideration when determining their own fate. When things are equal, we are allowed to tip the scales in our own favor.

I do not know how to explain this. Like the claim that we have some reason to promote self-interest, this principle seems to be a basic axiom of any plausible ethical view. Yet even if we accept that people are morally allowed to give themselves some priority, that does not mean that they are allowed to give themselves complete priority over others. Ethical egoism claims that the interests of others, considered in themselves, count for nothing. We are to treat our own interests as the only thing of importance.

Ethical egoism tells us that even when the stakes are very high for others, and very small for ourselves, we are entitled to ignore the needs, wants, and interests of those who are our equals in all relevant ways. Ethical egoism completely denies the moral importance of other people or other things (such as the environment), except insofar as they can help us to benefit ourselves. That is a kind of deep bias that requires substantial defense. It isn't clear what that defense would be.

Conclusion

Ethical egoism tells us that morality is all about making myself (whoever I happen to be) better off. If egoism is true, then we have only one basic moral duty: to maximize self-interest, even if doing so means killing others, stealing from them, or framing them for crimes that we committed. If egoism is true, we have no direct duties to help others in need, even if offering such help costs us nothing. It is clear that for these reasons, egoism violates a number of our core moral beliefs. As such, egoists must offer really compelling arguments to get us to abandon those core beliefs and switch to the new ones that egoists prefer. Yet even the best argument for ethical egoism is not good enough. Until we are presented with a new argument for ethical egoism, we are right to be highly skeptical of its claims.

If doubts about ethical egoism are on target, then morality does indeed place some intrinsic value on the interests of others. But how far should this be taken? Must we sacrifice everything for others—even for strangers? Or is there some middle ground, a principled way to balance our own needs with everyone else's?

The next theory we consider, consequentialism, will begin the process of shifting the moral focus away from ourselves. As we'll see, consequentialists don't deny the value of self-interest. They just deny that your interests are any more valuable than anyone else's. This move to impartiality is very important in moral thinking. Let's see how far it can take us.

Discussion Questions

1. What is the difference between psychological egoism and ethical egoism? Does the truth of one of these theories imply the truth of the other?
2. Is it ever in one's self-interest to commit rape, murder, or theft? If so, does this affect the plausibility of ethical egoism?

3. Would everyone be better off if each of us just pursued our own self-interest? If so, is this a strong consideration in favor of ethical egoism?

4. Is it ever rational to act contrary to one's self-interest? If so, under what circumstances? If not, does this show that ethical egoism is true?

5. Most people agree that discrimination on the basis of morally irrelevant traits (such as race or gender) is immoral. Does ethical egoism endorse such discrimination, by promoting one's own interests over the interests of everyone else? Why or why not?

Chapter 9

Consequentialism

Its Nature and Attractions

Thus did John Wesley (1703–91), English religious thinker and founder of the Methodist Church, sum up his philosophy of life. Our business here on earth is to do good—as much and as often as we can. Our efforts must extend beyond ourselves, to all whom we might help. Benevolence should be our guiding aim, and a life of altruism and good works should be the record we leave behind.

Wesley's advice can be summarized quite simply, in the motto that defines the consequentialist outlook: do as much good as you can. It is a very attractive picture of the moral life. It requires us to move beyond egoistic concerns, and to focus on improving the lives of others, as well as our own. We must make the world the best place it can be. Can anyone seriously argue with such a claim?

Some very fine philosophers have thought it impossible to reject this view. G. E. Moore (1873–1958), an English thinker famous in his day for his rigorous thought, declared it plain that what is right is whatever produces the most good. If you have a choice between two options, and the first is less good than the second, choosing the first can't possibly be right. Acts are morally right just because they maximize the amount of goodness in
Moore thought that those who failed to accept this simply didn't know what they were talking about.1

Certainly, any plausible moral theory will insist on the central importance of doing good. We commonly justify our actions by pointing to the good they did, and criticize actions by showing that they caused unnecessary harm. That makes perfect sense if consequentialism is correct.

Before we get to the details of the consequentialist picture, let's briefly consider a contemporary puzzle—the morality of capital punishment—that can illuminate the basic nature of this ethical outlook. There are many views about the morality of the death penalty, but most of them can be sorted into two large groups. In the first, consequentialist camp, people insist that such punishment is justified only if it improves our lives. It will have to decrease crime, increase security, and expand respect for human life. If capital punishment is to be justified, we must show that we will be better off with it than without it. We must look to the future, and ask three things: What are the benefits of executing criminals? What are the drawbacks? Which policy would yield the greatest cost-benefit ratio? Survey all of the available options. Whichever policy is optimific (i.e., such as to yield the greatest balance of benefits over drawbacks) is the one that morality requires.

A second group asks not about what the future will hold, but rather about what the past requires of us. Specifically, the focus is on whether certain people deserve to be killed for the crimes they have committed. On this line of thinking, even if the death penalty is extremely costly, fails to prevent crime, and perhaps even increases the crime rate by making the population more hard-hearted, we should still impose it if we can show that criminals deserve to be executed. Before we consider making people happy, or reducing their misery, we must first do justice. If giving out just deserts happens to reduce crime, so much the better. But if it doesn't, we should still execute the murderers among us if they deserve it.

My aim here isn't to try to resolve this thorny issue, but rather to reveal what is distinctive about the consequentialist approach to ethics. Consequentialists are those who encourage us not to cry over spilt milk. They direct our attention to the future, not the past. They ask us to look at the consequences of our actions or policies—hence the name of their theory. For them, the ends justify the means, so long as the ends are good enough. When we want to know whether our plans are in line with morality, we will ask about results. Did my action achieve better results than any other I could have done? If so, then my action was morally required. If not, then it wasn't.

The Nature of Consequentialism

Its Structure

Consequentialism says that an action is morally required just because it produces the best overall results (i.e., is optimific). But how can we determine whether an act is optimific? It won't always be an easy thing to do in practice. But in theory, it's pretty straightforward. There are five steps to this process:

1. First, identify what is intrinsically good—valuable in and of itself, and worth having for its own sake.2 Familiar candidates include happiness, autonomy, knowledge, and virtue.
2. Next, identify what is intrinsically bad (i.e., bad all by itself). Examples might include physical pain, mental anguish, sadistic impulses, and the betrayal of innocents.
3. Then determine all of your options. Which actions are open to you at the moment?
4. For each option, determine the value of its results. How much of what is intrinsically good will each action bring about? How much of what is intrinsically bad?
5. Finally, pick the action that yields the best balance—the highest ratio of good to bad results. That is the optimific choice. That is your moral duty. Doing anything else—failing to strike the greatest balance of good over bad—is immoral.

We can develop dozens of different versions of consequentialism, depending on which things we regard as intrinsically valuable. We could say, for instance, that acts are right just in case they yield the greatest improvement in environmental health, or best advance the cause of world peace, or do more than any other action to increase the amount of knowledge in the world. Each of these is a version of consequentialism.

Thus consequentialism isn't just a single theory, but is rather a family of theories, united by their agreement that results are what matter in ethics. We can't discuss every member of the family here, so I will

2. For more on intrinsic value, see the discussion in chapter 1, pp. 21–23.
restrict my attention, for the most part, to its most prominent version—act utilitarianism.

According to act utilitarianism, well-being is the only thing that is intrinsically valuable. And faring poorly is the only thing that is intrinsically bad. Thus this view states that an action is morally required just because it does more to improve overall well-being than any other action you could have done in the circumstances. Philosophers call this ultimate moral standard the principle of utility.

Some utilitarians have been hedonists; others, desire satisfication theorists; still others have defended the idea that there are a variety of things that directly contribute to our welfare. At present, we don't need to take a stand on this matter. The important point is that, according to act utilitarianism, acts are right just because they maximize the overall amount of well-being in the world.

When there are attractions and difficulties that are specific to act utilitarianism, as opposed to other versions of consequentialism, I note them. But for the most part, we can get a good sense of the consequentialist ethic just by focusing on act utilitarianism.

Maximizing Goodness

If act utilitarianism (henceforth, just utilitarianism) is correct, then we are duty-bound to maximize well-being. But what, exactly, does this mean? John Stuart Mill (1806–1873), one of the greatest utilitarians, famously summarized the utilitarian outlook by saying that it required us to create the greatest good for the greatest number. But this popular slogan overlooks an important nuance, one that Mill was well aware of.

Mill was a hedonist, who believed that only happiness was intrinsically valuable and only misery was intrinsically bad. Let's just assume the truth of hedonism for the moment, to better appreciate what maximizing goodness requires. If we combine utilitarianism and hedonism, we get this ultimate moral principle: produce the greatest overall balance of happiness over misery. There are two common misunderstandings of this principle. Let's clear them out of the way first, so that we can see what Mill really had in mind.

First misunderstanding: in choosing among acts that benefit people, we must benefit the greatest number of people. Mill rejects this.

Second misunderstanding: we must always choose that action that creates the greatest amount of happiness. Mill also rejects this.

Suppose we have to choose between two plans. The first creates more happiness than the second. Mill's principle does not say that we automatically have to favor the first plan. That's because the benefit to the majority may be very small, whereas the benefit to the minority may be very large.

Imagine that the legislature has a surplus this year. They could spend that money giving 90 percent of the citizens a $50 gas coupon. Or they could spend that money trying to prevent homelessness and starvation among the poorest 10 percent. In a variety of plausible scenarios, giving the money to the poor will yield more good, even though that benefits fewer people. If that is so, then the money must be directed to combat poverty.

Second misunderstanding: we must always choose that action that creates the greatest amount of happiness. Mill also rejects this.

Suppose we have to choose between two plans. The first creates more happiness than the second. Mill's principle does not say that we automatically have to favor the first plan.

That's because the first plan may also create a huge amount of misery, while the second plan creates very little. Imagine a Roman emperor who wanted to please his public. His choice: offer gladiator contests, or a series of grand athletic competitions. Suppose that watching the gladiators would create more happiness. But imagine, reasonably, that this would also create much more misery than the athletic games would do. It might be that the games would produce the greatest net balance of happiness over misery, even though more total happiness would have been created by offering a chance to see men killing one another.

The correct interpretation: utilitarians tell us to do what brings about the best overall situation, by choosing the act that creates the greatest net balance of happiness over unhappiness. So out with the gladiators and in with the athletes.

Moral Knowledge

Utilitarians make the rightness of an action depend on all of its results, no matter how long after the action they occur. There is no statute of limitations on counting consequences. Sometimes the results of one's actions do not last more than a moment. In other cases, they may continue for decades or centuries. (Just think of Lincoln's assassination or Jesus' crucifixion.)

This raises an immediate worry. If the rightness of an action depends on all of its results, and these haven't yet occurred, then how can we know whether an action is the right one to do? Utilitarians are split on how best
to answer this question. The first group thinks that the morality of actions depends on their actual results; the second group thinks that it depends instead on their expected results. This makes a big difference in the utilitarian account of how we gain moral knowledge.

The standard view is the first one. Right actions are those that actually bring about the best possible results. But since these are still in the future when the action is performed, we can never be completely sure that what we are about to do is the right thing.

Yet every moral theory has to allow for some degree of moral ignorance—cases where we don’t know what is right or wrong. We are not morally infallible. Many utilitarians explain this by saying that since we don’t have a crystal ball, and can’t perfectly predict the future, we can never be certain in advance that our actions are morally right.

Still, there is a huge amount of past experience that we can call upon. For instance, we can be reasonably sure that if we were to pick up a gun and shoot a perfect stranger at point-blank range, then the results would be disastrous, for instance. But we should not expect certainty when it comes to moral questions.

Other utilitarians are uncomfortable with this. They want to make moral knowledge easier to get. As they see it, we should be able to know the morality of our acts when we perform them, rather than having to wait until all of the results are in. After all, if we had to wait for those results, we might never know the morality of some of our actions, since they could have unexpected results that occur even after our deaths.

For utilitarians in this second camp, the solution to this worry is to make the rightness of actions depend not on their actual results, but on their expected results. On this view, acts are morally required just because they are reasonably expected to be optimific. Since we are often in a position to make reasonable predictions about the results of our actions, we can often know, prior to performing them, whether they are morally right or wrong.

Actual versus Expected Results

Suppose that, with the best possible motives, I take an aged stranger’s arm and help him across the street. As we cross, a reckless driver crashes into my companion, killing him. Had I not tried to be kind, he would still be at the curb, a bit delayed, but unharmed. If the morality of an act depends on its actual results, then, from a utilitarian perspective, I did something immoral. A different option (refusing to help the man across the street) would have had better results.

If that sounds harsh, there is an easy remedy. If we evaluate actions based on their expected results, then, morally speaking, I am in the clear. That’s because anyone in my shoes could reasonably expect that helping the man across the street would have excellent results.

Interestingly, most utilitarians reject the view that makes rightness a matter of expected, rather than actual, results. The expected-results version makes it easier to get moral knowledge, and does not condemn actions that are reasonably expected to be optimific. But it has two problems that have lost it most of its supporters.

First, it will sometimes require actions that turn out to have disastrous results, when other options would have produced much better outcomes. Some acts that we expect to turn out well end up doing great harm, and when that is so, this proposal would still regard the disastrous actions as morally right.

Suppose, for instance, that I am a member of a parole board and have excellent evidence that a criminal has had a change of heart. I authorize his release and later read that he went on a killing spree just days afterward. Most utilitarians find it extremely difficult to morally prefer an act that resulted in many innocent deaths over one that would have resulted in none. They would say that my action was the wrong one, though (as we’ll shortly see) I am not to be blamed for it, since I had intended to bring about good results.

Second, some actions are expected to turn out badly, but end up with surprisingly good results. I remember a time as a kid when I got up my courage and confronted a bully, even though I thought that this would only make him nastier to me and his other victims. Instead, he unexpectedly backed down and stopped his harassment.

If utilitarians make rightness a matter of expected results, then they must judge my action to be morally wrong. But condemning an act with excellent results is too much for most utilitarians to stomach.

Assessing Actions and Intentions

If we stick to the classic version of utilitarianism, one that judges actions on the basis of their actual results, what should we say about cases where good intentions yield awful results, or bad intentions yield pleasant surprises? Here utilitarians will insist on separating the issues. They will have one standard for evaluating actions, and another for judging intentions.
Actions are right provided they are optimific. But intentions are morally good provided that they are reasonably expected to yield good results. So, in the case of my helping the pedestrian, these utilitarians would judge my action wrong, while praising my intentions. On this view, we cannot immediately say that I am to blame just because I did something immoral. Nor can we say that I am to be praised just because I did something right.

Imagine an assassin whose bullet misses its target, ricochets, and miraculously hits both the assassin and his accomplice, disabling them, revealing their location, and leading to their quick capture. In that case, we condemn the assassins, but judge their action to be right, since it had the best possible results. On this view, there is no essential connection between the morality of an action and the morality of the intentions behind it. If you are trying to do harm, when you had the chance to do good, then you are to blame—even if your action manages to maximize well-being. If you intend a kindness, then you are to be praised, even if, through no fault of your own, your action backfires and only misery results.

Here is the picture thus far. Consequentialists say that our fundamental moral duty is to make the world the best place it can be. Utilitarians in particular understand this to mean that we must contribute as much to the improvement of well-being as we can. Though theorists differ, most claim that whether an action is optimific depends only on its actual (and not expected) results. All results count, not just those that occur in the short term. When we fail to maximize good results, we act wrongly, even if we had the best intentions. Though good intentions may earn us praise, they are irrelevant to an action's morality. When we pass up a chance to do an action that would have had better results, we are doing something wrong. Always.

The Attractions of Utilitarianism

Impartiality

Utilitarianism is a doctrine of impartiality, and this is one of its great strengths. It tells us that the welfare of each person is equally morally valuable. Whether rich or poor, white or black, male or female, religious or not, your well-being is just as important as anyone else's. In the gladiator example, for instance, we didn't have to ask whether the happiness went to wealthy nobles or impoverished slaves. It didn't matter. Everyone's well-being counts, and everyone's well-being counts equally.

We nowadays take such equality for granted. But the idea, when advanced by the earliest utilitarians, was quite a radical one. Indeed, utilitarians have a long history of challenging conventional moral wisdom. Jeremy Bentham, whose Principles of Morals and Legislation (1781) gave the first really sophisticated defense of utilitarianism, was a dedicated abolitionist. Bentham's godson, John Stuart Mill, wrote one of the earliest and greatest works on behalf of female equality, On the Subjection of Women (1869). Peter Singer, perhaps the most famous living philosopher, continues the utilitarian tradition of seeking to expand our moral concerns with his influential work on behalf of ethical vegetarianism and against animal experimentation.

According to utilitarians, we develop a truly moral outlook only when we broaden our concerns so that we are not focused just on ourselves, or on our friends, family or fellow citizens. The moral point of view is nothing less than an impartial concern for everyone whose well-being may be affected by our actions.

The Ability to Justify Conventional Moral Wisdom

As the examples of abolitionism, sexual equality, and animal welfare show, utilitarians are not afraid of controversy. They know that their recommendations will sometimes conflict with popular opinion. But they don't regard that as a strike against their theory. Rather, they see it as a strike against popular opinion.

That said, utilitarians think that most of our deeply held moral beliefs are correct. There is a special reason for this, one that utilitarians regard as a great advantage of their view. As they see it, utilitarianism does a better job than any competing moral theory in justifying our basic moral beliefs.

Consider the things we regard, deep down, as seriously immoral: slavery, rape, humiliating defenseless people, killing innocent victims. Each of these clearly tends to do more harm than good. Utilitarianism condemns such acts. So do we.

Now consider the things we strongly believe to be morally right: helping the poor, keeping promises, telling the truth, bravely facing danger. Such actions are highly beneficial. Utilitarianism commends them. So do we.

Utilitarianism can also explain our shared views about virtues and vices. According to utilitarianism, a character trait is a virtue just because it tends to cause us to act in highly beneficial ways. Compassion, kindness,
and benevolence appear on almost anyone's list of central moral virtues. Utilitarianism has a natural account of this. Such character traits tend to promote our flourishing and to reduce misery.

Greed, malice, ingratitude—these are bound to make most people's top ten list of moral vices. Utilitarianism easily explains this. When people are motivated by such things, they tend to harm others. Utilitarians thus condemn such traits as vices. So do we.

Our core moral beliefs could be mistaken. But until we see an excellent argument for such skepticism, we are right to decide among competing moral theories by selecting one that justifies our deepest beliefs, and clashes with only a few of them. No moral theory manages to do this perfectly—as we'll see, each of the major views captures some fundamental moral beliefs, at the expense of some others. Still, utilitarianism earns pretty high marks in this department.

**Conflict Resolution**

One of the most important things that an ethical theory can do is to provide advice about how to resolve moral conflicts. Utilitarianism delivers. Because it has just a single ultimate rule—maximize well-being—it can offer concrete guidance where it is most needed.

Consider this familiar moral puzzle. I overhear some nasty gossip about my friend. She later asks me whether people have been spreading rumors about her. I know that she is extremely sensitive, and that if I answer honestly it will send her into a downward spiral for several days. I also know that the source of this gossip is someone who actually likes my friend, and was acting impulsively and out of character. She's probably feeling bad about it already, and probably won't repeat this unkindness.

Of course we need to know a lot more about the situation before we can be confident about a recommendation, but if we just stick with the details given here, the utilitarian will advise me not to reveal what I have heard. Honesty may be the best policy, but that doesn't mean that full disclosure is always called for. When we consider our options, utilitarians tell us to pick the one that increases overall well-being. Telling the truth won't always do that.

Utilitarianism thus gives us a clear method for resolving moral conflict. We can apply the principle of utility to determine which choice to make in difficult cases.

John Stuart Mill saw this clearly. In a fascinating discussion at the end of his *Utilitarianism* (1861), Mill touts the superiority of the utilitarian view of justice over its competitors. He does this, in part, through a discussion of taxation. We can all agree that our system of taxation must be just, but that doesn't get us very far. We can make a case that charging everyone an identical amount of money is just, since we are thereby treating everyone alike. Or we can insist that everyone pay the same percentage of his income—again, a form of treating everyone alike. Or we can require a graduated tax, taking a higher percentage from those who can most easily afford it. Which should we do?

Fans of each of these ideas (and others) will offer many arguments on behalf of their position. Sorting it all out could be excruciating, and that is because we have no clear way of applying the test that tells us to adopt just policies. Utilitarianism cuts through the conflicting claims and offers direct advice: maximize well-being. Of course it's not always easy to know which tax policy will do this, but at least we have a clear direction for pursuing our question.

Whenever we are faced with conflicting moral advice, utilitarianism can greatly simplify matters. It tells us to focus on just one question: which option will maximize well-being? Coming up with an answer will sometimes be hard. But at least we know where to look. That is (at least) half the battle won.

**Moral Flexibility**

During the winter of 1846–47, members of the Donner party, traveling by horse and coach in search of a pass through California's Sierra Nevada range, found themselves buried in heavy mountain snows. It wasn't long before their supplies of food and fuel ran out. Almost half of the eighty-seven members of their party died that winter. Some of those who survived faced a terrible choice. They could starve to death, or remain alive by eating the remains of their fellow travelers.

In the choice faced by members of the Donner party, one might regard the prohibition on eating human flesh as absolute—not to be violated under any conditions. Even though honoring the rule means losing one's life, some rules are never to be broken.

Utilitarians would disagree. And their disagreement is based not on specific views about cannibalism, but on very general grounds. For utilitarians, no moral rule (other than the principle of utility) is absolute. It is
morally okay to violate any rule—even one that prohibits cannibalism, or torture, or the killing of innocents—if doing so will raise overall well-being.

Utilitarians think that it is an excellent thing that so many of us are unwilling even to contemplate such actions. Our reluctance is almost always beneficial. But in unusual situations, we are right to violate taboos or break familiar, deeply held moral rules if we maximize well-being in doing so.

Utilitarianism is thus a doctrine of moral flexibility. Most of us think that moral rules must allow some exceptions. But where to draw the line? How do we know whether to follow a moral rule or to break it? Utilitarianism gives us an answer. Morality is not a free-for-all. It is not a case of “anything goes.” We ordinarily do best when we obey the familiar moral rules (don’t steal, lie, kill, etc.). But there are times when we must stray from the conventional path in order to improve overall welfare. When we do this, we do right—even if it means breaking the traditional moral rules.

The Scope of the Moral Community

In the winter of 2007, two high school boys from Reading, Ohio, decided to have some fun. They sprayed Lysol into a cat’s face, crushed its spine, popped its eyes out, impaled it with a stake, and dismembered it. Then they bragged to their classmates about what they had done.

What these boys did was very wrong, and utilitarians have a ready explanation of this. Most competing moral theories do not.

Utilitarians argue that animals are members of the moral community. To be a member of the moral community is to be important in your own right. It is to be owed a certain amount of respect. Membership in the moral community imposes a duty on everyone else to take one’s needs seriously, for one’s own sake.

Every moral theory needs to have a way to determine who gains entry to the moral community. The utilitarian test is recorded in a famous slogan by Jeremy Bentham: “the question is not Can they reason?, nor Can they talk?, but Can they suffer?”

Tables and chairs are not members of the moral community. Neither are cars. We owe them nothing. They are important, when they are, only because we care about them. If we had no interest in them at all, then there would be nothing wrong with having them destroyed. Utilitarianism easily explains their second-class status: such things can’t suffer, and so they have no independent moral importance.

But animals are a different matter. They are members of the moral community. They are important in their own right. Their importance does not depend on whether we happen to care about them. And the utilitarian explanation of this is very plausible: Animals count because they can suffer. Those teenagers from Ohio caused excruciating, pointless suffering. That’s why their actions were so terrible.

Just to be clear, utilitarians allow that it is sometimes okay to harm members of the moral community. There are many cases in which maximizing overall well-being comes at a price. For instance, it may be acceptable to conduct certain intensely painful animal experiments, provided that they bring about very beneficial results. The point here is that, from the utilitarian perspective, we are not allowed to ignore the suffering of others. It doesn’t matter whether the victims are human beings or not.

Indeed, utilitarians have argued that species membership is, in itself, completely morally irrelevant. What counts is whether you can suffer, and nonhumans can certainly do that. If an animal suffers to the same extent as a human, that is an equal misfortune. Harming a human is not, in and of itself, any worse than causing the same harm to a (nonhuman) animal.

A number of utilitarians have advanced a powerful argument that relies on this controversial position. It is called The Argument from Marginal Cases:

1. If it is immoral to kill and eat “marginal” human beings, and to painfully experiment on them, then it is immoral to treat nonhuman animals this way.
2. It is (almost) always immoral to kill and eat “marginal” human beings, and to painfully experiment on them.
3. Therefore, it is (almost) always immoral to kill and eat animals, and to painfully experiment on them.

I dislike the name of this argument, because I think it distasteful to refer to any human being as “marginal.” But its name is so familiar in philosophical circles that we will stick with it here.

“Marginal” human beings are those whose mental lives are no more developed than those of the nonhuman animals we routinely eat and experiment on. There are many causes of such developmental limitations: severe brain trauma, extreme mental retardation, and so on. The basic idea

behind the Argument from Marginal Cases is that such human beings are no more morally important than the animals we harm in our labs or factory farms. Since they are of equal importance, we must treat them equally. If we are not prepared to eat or experiment upon such human beings, then we shouldn't be willing to treat animals that way, either.

Many people find the Argument from Marginal Cases repugnant. They recoil at giving animal interests the same weight as those of human beings. Utilitarians push back: everyone counts, and everyone counts equally. Everyone means every member of the moral community. Animals are members. So their interests count for just as much as those of human beings.

Almost no one rejects premise 2 of the Argument from Marginal Cases. You've got to be awfully hard-hearted to be willing to subject marginal human beings to the sort of treatment we apply to animals in our labs and farms. True, there might be rare exceptions where such treatment is acceptable—that's the point of saying that it is *almost* always wrong to do such things to human beings. But these would have to be extremely unusual cases.

So the real action occurs in premise 1. Its defenders support it in this way. They say that marginal human beings, and farm and lab animals, are moral equals. They are moral equals because (as utilitarians see it) they can equally suffer. And, as moral equals, anything that is wrong to do to one of them should be wrong to do to the others.

The obvious place to attack this reasoning is with the claim that animals and marginal humans are moral equals. If you don't like that claim, then it is up to you to find a better test for inclusion in the moral community. Familiar examples are problematic.

Perhaps the ability to reason is the relevant test. As we know, Bentham rejected this test, but even if he was wrong to do so, this isn't going to help. That's because the reasoning powers of marginal humans are no better than those of animals. In fact, some animals—such as pigs and primates—are very smart, and no doubt smarter than some human beings.

There are many other tests of independent moral importance that philosophers have advanced. Here are some of the most popular ones: the ability (1) to communicate, (2) to have emotions, (3) to elicit sympathy from others, (4) to be self-aware, (5) to be self-governing, (6) to assert claims on one's behalf, or (7) to anticipate one's future.

Utilitarians insist that the capacity to suffer is a better test of membership in the moral community than any of these seven alternatives. But even if you have doubts about that—and many do—utilitarians will argue that animals and marginal humans fare equally well on each of these tests. Many animals possess these traits or abilities to the same degree as marginal human beings.

In my experience, most people at this point try to argue in one of two ways. Some say that every human is more important than any animal, because God created each of us as an exalted being whose life has more value than that of any animal. Well, that's a possibility, but defending it is a task for theologians, as the defense will ultimately rest on claims about God's existence and His purposes and intentions. So we are going to leave this aside.

Another thing that people often say in this context is that marginal human beings, *just because they are human*, are more important than animals. On this view, the test of whether you are a member of the moral community is whether you are human. No matter how "marginal" a person is, he or she is still a human being, and so more important than any animal.

But this is a bad argument. It clearly begs the question against the utilitarian. You're not going to accept this line of reasoning unless you already accept the view that all marginal humans are more important than all nonhuman animals.

Further, we should ask why species membership is the all-important test of moral status. Your genetic code, or the species of your parents, doesn't seem to be what establishes your moral importance. To see this, imagine a time, perhaps not so far in the future, in which we encounter (or create) beings who are like us in every way—except that they are made of silicon. They think like us. They feel emotions as we do. They are self-aware. They feel pain. They look exactly like us. The only difference between them and us is which species we belong to.

I don't know how to argue for this, and perhaps you disagree, but it seems to me that this difference doesn't justify treating these beings as second-class citizens. In fact, it seems that they are just as morally important as we are—after all, without cutting them open, we couldn't tell them apart from a human being, because they are identical to us in every way except the internal circuitry.

If you share my view about this case, then you should reject the idea that species membership is, in itself, a morally important trait. And if that is so, then we can't resist the Argument from Marginal Cases by claiming that marginal human beings, just by virtue of their humanity, are more important than animals.
Thus if you do think that every marginal human being is more impor-
tant than every nonhuman animal, then the ball is in your court. You have
to identify a litmus test of moral importance that is better than the utilitar-
ian one, and one that gives humans an edge, no matter how mentally
developed they happen to be. It won’t be easy to do this. Many think it can’t
be done. Exercise: see for yourself.

Utilitarianism makes it pretty easy to gain entry into the moral com-
unity. Infants, toddlers, the severely mentally retarded, the extremely
mentally ill, and almost all nonhuman animals are members. It certainly
seems that these people and animals are important in their own right.
They are not mere playthings to be used for our own purposes. We owe
them respect. Utilitarianism easily explains why this is so.

Discussion Questions

1. How does act utilitarianism differ from ethical egoism? Which do you
think is more plausible and why?
2. What is it for an action to be optimific? How might an action bring about
more happiness than any other alternative, but still fail to be optimific?
3. Most utilitarians think that sometimes people are not to blame for per-
forming actions that are very wrong, and that sometimes people should
not be praised for doing the right thing. Why do they think this? Do
you agree?
4. Utilitarians think that some humans are morally equal to some animals.
What exactly do they mean by this, and how do they argue for it? Do
you agree with them? Why or why not?
5. To what extent does utilitarianism support your own deeply held moral
beliefs? Are there any cases in which you disagree with the verdicts of
utilitarianism?

Measuring Well-Being

According to utilitarianism, we must do what is optimific. We must max-
imize overall well-being. Thus, to know whether an action is morally
required, we need to do four things: (1) add up all of the benefits it pro-
duces, (2) add up all of the harm it causes, (3) determine the balance, and
then (4) see whether the balance is greater than that of any other avail-
able action.

There are many complex cases where it is impossible in practice to
follow these steps. There is simply too much information to be gotten, and
no one is smart enough or has time enough to gather it all. This explains
the extent of our moral ignorance, according to utilitarians. But if it is
impossible in principle to follow these steps, then utilitarianism is sunk.

Some people do think it impossible. They think that there is no way to
undertake step 1 or step 2. Since the problems are the same for either one,
let’s just focus on step 1.

There are in fact two worries here. The first one was discussed in the
previous chapter (pp. 121–22), so we can be brief. To add up the benefits
or harms of an action, we need to take note of all of its results. Yet in some
cases, those results will continue to occur for decades, even centuries, after
the action took place. That means that we’ll never be able to do the needed
measurement. And that means that we cannot know whether the actions
are right or wrong.

The utilitarian will reply, as before, that every theory must have a story
about why we are sometimes morally in the dark. Utilitarianism accounts
for moral ignorance by saying that moral knowledge requires knowing all of an action’s results and their value. It’s true that we don’t always have a grasp of this information. But that just means (according to utilitarians) that we have less moral knowledge than we may have thought.

Let’s turn our attention to the second concern. In order to add up all of the good produced by an action, I would need some way to measure it. Well-being would have to come in quantities so that I could measure the amount of one person’s welfare, measure another’s, and another’s, and add them all together. But that seems completely implausible.

This problem could be solved if well-being were simply a matter of the degree to which our desires were satisfied. We could then determine how well off someone was by noting what percentage of his desires were fulfilled. But as we saw in chapter 4, this view has some serious flaws.

Things will be incredibly complex if we opt for a pluralistic view of well-being. Such a view claims that there are many sources of personal welfare. The list differs from philosopher to philosopher, but familiar candidates include knowledge, virtue, love, happiness, and friendship. The idea is that the more you have of these things, the better your life is going for you.

This sort of view creates really hard problems of measurement. How are we to measure degrees of friendship? Of love? Of virtue? And then combine them into some overall measure of personal welfare?

Pluralism raises hard problems even if we think that there are only two components of well-being, rather than many. Suppose, for instance, that happiness and autonomy are the only things that contribute to a good life. If utilitarianism is right, then we must maximize both of these values.

The problem is that it is not always possible to do this. Sometimes we have to choose between happiness and autonomy. Suppose that a patient is dying but doesn’t know it. His family begs his doctors to keep this a secret, knowing that he will sink into a terrible depression if he learns the truth about his illness. Still, keeping that information from the patient undercuts his autonomy. In such a case, doctors may either respect the patient’s autonomy or allow him some happiness. They can’t do both.

There are many cases like this. Should parents allow their teenage daughter to date an older man they know to be abusive? Should families intervene to prevent a relative from joining a cult? Should a superpower undermine the results of a foreign democratic election, if the newly elected government is set on oppressing its citizens and waging war against innocent neighbors? Answering such questions of course requires a great deal of information. But once we have it, we may still face a choice between respecting autonomy and reducing misery. When that is so, which should we do?

Utilitarianism has no way of answering this question, once we allow that both autonomy and happiness are intrinsically valuable. If happiness were all-important, then we could always give the nod to it. If autonomy were the supreme value, we could insist on honoring it, even at the cost of unhappiness. But if the two are both of ultimate importance, then it is very hard to know what to do if they conflict.

John Stuart Mill himself encountered something like this problem, even though he thought that happiness is the only thing that is intrinsically valuable. He wanted to protect utilitarianism from the objection that it was a “doctrine of the swine,” attractive only to those who preferred a life of easy pleasure to the more challenging intellectual pleasures. To Bentham’s motto “Pushpin is as good as poetry” (pushpin is a simple tavern game), Mill replied that “it is better to be Socrates dissatisfied than a fool satisfied.” Bentham urged us to maximize pleasure, no matter its quality. Mill couldn’t stand that. He insisted that we maximize the quality of our pleasures, as well as their quantity.

Leave aside Mill’s elitism here, his view that some pleasures are “higher” than others. The deepest problem lies in his demand that we maximize two things (quantity and quality of pleasures), not one. But what if we can’t do both? A big bag of potato chips, a six-pack, and the TV clicker may bring loads of low-level fun. Or I could spend the same five hours trying to reconstruct a difficult philosophical argument. Little pleasure, but very high quality. There is no principled advice that the utilitarian can offer here, so long as both the quantity and the quality of pleasure are of ultimate importance.

Problems of value measurement arise even if there is only a single intrinsic value, such as happiness. After all, happiness comes in many flavors. There is the happiness of momentary elation, of steady contentment, of physical excitement, of mental challenge, of exhausted gratitude. And that is only a small portion of the catalogue. Given these different kinds of happiness, it would be very surprising were there some common measure of happiness that applied to each person.

These problems can be summarized in the Argument from Value Measurement:
1. Utilitarianism is true only if there is a precise unit of measurement that can determine the value of an action's results.
2. There is no such unit of measurement.
3. Therefore, utilitarianism is false.

I think that utilitarians should admit that premise 2 is true. There is no precise unit that can measure happiness or, more generally, well-being. So utilitarians must resist premise 1. But how? After all, utilitarians are asking us to compare different actions on the basis of which one maximizes well-being. When we make other comparisons, and ask (for instance) about which person is tallest, or fastest, or wealthiest, we can do this just because there are precise units of measurement to rely on. Height can be parceled out in millimeters; speed in fractions of a second; wealth in terms of dollars and cents. These precise units of measurement enable us to determine when the relevant "value" (height, speed, wealth, etc.) is maximized. Such examples make premise 1 look very appealing.

Still, I think utilitarians are right to reject it. There are clear cases where some actions create more overall benefit than others, even though there is no precise way to quantify these benefits. Consider the good produced by a kindly grandmother who takes in her wandering, orphaned grandchildren, and compare that to the benefits of a couple enjoying a friendly game of cards. The first case is obviously more beneficial than the second. So long as there are clear cases such as this one, there must be some way to measure benefits, even if it is imprecise.

And we can, of course, say the same thing about harms. There is certainly a harm when a husband curses his wife in front of their children. But there is far more harm when a cholera outbreak hits a refugee camp. We can't say precisely how much more harm there is. But it is clear that there is a greater amount in one case than another. That is enough, I think, to cast doubt on premise 1 of the argument.

I think that these examples are also enough to show that we can—at least sometimes—fulfill steps 1 and 2 of the utilitarian calculus. We can survey our options and determine which is most beneficial, and which is most (or least) harmful.

Still, there is trouble when it comes to steps 3 and 4. Step 3 asks us to compare the amount of benefits and harms and then, in step 4, to strike the greatest balance. But what does this really mean? I think the best sense to be made of this idea is the one I relied on earlier (see p. 121): The ratio of benefit to harm should be as great as possible. We needn't benefit the greatest number of people. Nor must we opt for the action that produces the greatest amount of well-being (since that same action might also produce much more misery than alternative actions). But since neither benefit nor harm comes in precise amounts, we shouldn't take the ratio idea too seriously.

What we can say, on behalf of utilitarianism, is that there will be easy cases, cases where the morality of the action is clear. If, among all of one's choices, there is an act that produces both the most benefit and the least harm, then that is your moral duty. If, among all of your choices, there is no chance of improving well-being, then you must choose the act that will cause the least amount of harm. Of course, since we aren't able to precisely quantify harm or benefit, it may be unclear which choice produces the most benefit, or the least harm. But when it is, these guidelines give straightforward moral advice that the utilitarian will endorse.

The problem is that many situations we face in the real world are not like either sort of case I've just described. Whether one act is optimific can be quite unclear—not because we are ignorant of all of its results (though we often are), but rather because there is no way to be precise about the amount of benefit and harm it causes. When two or more acts each promise to produce some benefit, at the cost of some harm, there may be no real answer to the question of which action is optimific. And this is where we stand in most cases. If that is so, then utilitarianism will have lost one of its primary advantages—namely, its ability to give concrete advice about what to do in morally complex situations.

Utilitarianism Is Very Demanding

There are three areas in which utilitarianism seems to demand too much of us mere mortals: deliberation, motivation, and action. Let's consider these in turn.

Deliberation

It might seem that in order to think about how to act, we must first know a huge amount of information. We must know all of the options we face, and their likely results. Then we must determine the overall value of each of our options. And then compare these values to see which yields the optimific outcome. Sometimes in a matter of seconds.

But that's just impossible. We're not computers. We can't gain that kind of knowledge in advance of every action. Utilitarianism simply demands too much information, and calculating skills that no one could possibly possess.
Mill had a ready reply to this objection. Christians can usually know perfectly well what their religion requires of them, without having to reread the entire Bible prior to each action. They rarely need to spend a lot of time reflecting on it to know that raping or killing someone will cause more harm than good. In most situations, we can rely on common wisdom, based on thousands of previous cases, to know what is going to be beneficial or harmful.

Of course there are exceptional circumstances, ones where we do have to stop and carefully puzzle out the pros and cons of a given action. But that’s not a problem for utilitarianism—all moral theories allow for such cases.

Furthermore, it simply defeats the purpose of doing good if you spend so much time deliberating. The person likeliest to fulfill the utilitarian goal of improving the world is the one who knows when to stop and think about her choices, and when not to. Too much time pondering one’s options can freeze a person, and result in too many wasted opportunities. Ordinarily, it is far better to act spontaneously; we can make time for careful calculation in those rare cases where it is truly needed.

Motivation

Still, doesn’t utilitarianism require us to be saints, always on the lookout for chances to do good? Must we always try to do what is optimific?

A plausible moral theory is one that most of us can live by. But asking us to be constantly benevolent, never taking more than a moment or two for ourselves—how many of us can be so altruistic? If no one but a saint can meet its standards, then utilitarianism is in deep trouble.

Utilitarians would agree with this. They do not believe that we must always be strategizing about how to improve the world. The reason is simple. People motivated in this way usually fail to achieve their goal.

The idea is that those who are always trying to get the best outcome are often bound to miss it. This isn’t as strange as it sounds. Think of people whose sole purpose in life is to be as happy as they can be. Such people are rarely very happy. Constantly striving for this goal only makes it more elusive.  

1. Recall the discussion of this point as it relates to the paradox of hedonism in chapter 2, pp. 30–31.

So, too, with pursuing global happiness. Those who aim only for this tend to be busybodies, cranks, obsessives. (Go read Nick Hornby’s How to Be Good, a novel whose central character, David Carr, has committed himself to doing as much good as he can. Result: he brings only misery to family and friends.) Having only a single motive—producing the greatest good for the greatest number—would almost certainly backfire. If that is so, then utilitarians are off the hook. Their theory would not require non-stop benevolence from us.

There is another way to think about these criticisms regarding deliberation and motivation. To understand this new take on the subject, we need to distinguish between a decision procedure and a standard of rightness. A decision procedure is just what it sounds like—a method for reliably guiding our decisions, so that when we use it well, we make decisions as we ought to. A standard of rightness tells us the conditions that make actions morally right.

Consequentialism is, above all, a standard of rightness. It says that an action is right just because it is optimific. This standard is meant to explain precisely why actions are right, when they are.

Importantly, a standard of rightness need not be a good decision procedure. Indeed, most consequentialists think that their standard of rightness—the principle of utility—fails as a decision procedure. Unless we find ourselves in very unusual circumstances, we should not be asking ourselves whether the act we are about to do is optimific.

The reasons given earlier explain this. Using the principle of utility as a decision procedure would probably decrease the amount of good we do in the world. That’s because we would probably spend too much time deliberating or second-guessing our motivations, thereby reducing our chances of doing good. Whenever that is so, utilitarians require that we use something other than the principle of utility to guide our deliberations and motivations.

Action

The last area in which utilitarianism is said to be too demanding is that of action. Even if we needn’t always deliberate with an eye to doing what is optimific, and even if we needn’t always have a saint’s motivations, we really must act so as to achieve optimific results. Whenever we fail, we are behaving immorally. That is bound to strike most people as excessive.

Recall John Wesley’s motto: Do all the good you can, by all the means you can, etc. Such a life would be one of great and constant self-sacrifice.
Anytime you can do more good for others than you can for yourself, you are required to do so. If you are like most readers of this book—in no danger of starvation, able to afford a night out, a new pair of jeans, a vacation every so often—then utilitarianism calls on you to do a great deal more for others than you are probably doing.

Consider the extraordinary Dr. Paul Farmer, profiled in Tracy Kidder’s book Mountains beyond Mountains. Farmer is a professor at Harvard who cofounded Partners in Health, a nonprofit group designed to provide free treatment to many of the world’s poorest people. Before moving with his family to Rwanda a few years ago, Farmer spent most of the year apart from his wife and young daughter, to maximize the time he could spend treating critically ill patients in rural Haiti. He lives like a pauper and donates his Harvard salary to Partners in Health. He doesn’t take vacations—if he did, some patients would die whose lives he could have saved. He tries (but fails) to love his wife and daughter no more than anyone else. He insists that everyone—no matter how poor, how socially disadvantaged, how distant from us—is deserving of an equal chance to live a decent life. He doesn’t cite utilitarianism as the basis of his work. But he comes as close as anyone I’ve heard of in living up to the strenuous demands that utilitarianism imposes.

Now you might be thinking that Farmer is an exception. You’re not a doctor; you are in no position to save lives. Utilitarianism demands so much of Farmer because of his special expertise. When it comes to the average person, though, utilitarianism doesn’t require much self-sacrifice at all.

But think again. If I have a choice between spending $1,000 on a beach vacation and sending that money to UNICEF (the United Nations Children’s Fund), it’s an easy call. UNICEF literature claims that $1,000 can provide 100 families with a basic water kit for use during emergencies, immunize 1,000 children against polio, or provide enough woolen blankets to cover 250 children during winter-weather emergencies. I’d be unhappy if I had to give up my vacation. But my unhappiness pales in comparison to the suffering of those whose lives could be saved if I spent my money on them, rather than myself. If utilitarianism is correct, then no more vacations for me (or you, probably).

There is an important lesson here: utilitarianism cannot make room for supererogation—action that is “above and beyond the call of duty.” Such behavior is admirable and praiseworthy, but is not required. A classic case of supererogation is that of a bystander dashing into a burning building in order to rescue strangers trapped inside. Utilitarians must deny that even this is a case of supererogation, because they deny that any actions are above and beyond the call of duty. Our moral duty is to do the very best we can do. If, among all of the options available to you at the time, dashing into the building is going to minimize harm, then this is what you must do. Attempting the rescue isn’t optional. It is your duty.

Utilitarians know that this isn’t going to go down very easily, but they reply that morality can indeed be quite demanding. Most of us believe, for instance, that morality can sometimes require us to give up our great enjoyments, and occasionally our lives. So the real issue isn’t whether morality can be extremely demanding—it can. The issue is how often morality will ask us to sacrifice our own interests for those of others.

Our views about how much sacrifice morality requires are shaped by how we have been raised. Most of you have been brought up in relatively wealthy societies, where citizens are used to tax rates that leave them a lot of discretionary income. Suppose, instead, that you were raised in a society that celebrated an ethic of giving, one that made it a real priority to benefit the poor. In that case, you’d probably think it criminal to give only a small fraction of your money to relieve poverty.

Utilitarians must agree that their view can demand great sacrifices of those who have a lot to give, and frequent and substantial sacrifices from the rest of us. That the implications of a moral theory are burdensome, however, is not a decisive strike against it. That it threatens the status quo and challenges the comforts of the well-off may be a mark of its truth, rather than its falsity.

Impartiality

The impartiality required by utilitarianism really is a substantial benefit of the theory. The happiness of a celebrity or a billionaire is no more important than that of a homeless person or a refugee. From the moral point of view, everyone counts equally; no one’s interests are more important than anyone else’s.

Yet there is also something worrying about impartiality, since morality sometimes seems to recommend partiality. It seems right, for instance, that I care about my children more than your children, that I care more for friends than strangers, more for my fellow citizens than those living halfway around the world. And it also seems right to translate my care into action. If I have saved a bit of money, and it could either pay for my son’s...
minor surgery or relieve the greater suffering of famine victims, most of us will think it at least permissible to pay the surgeon. But to do that is to be partial to the interests of my son. Utilitarianism does not allow that. It rejects the idea that a person, just because he is my son, my dear friend, or my fellow citizen, is more deserving of my help and attention.

Utilitarians can argue that there are many situations in which we should give preference to our near and dear—not because they deserve it or are more important than strangers, but because that is what is most beneficial. They could argue, for instance, that the results of sending my money overseas would actually be worse than relieving my son’s suffering. Utilitarians will remind us that we must consider all consequences, not just short-term ones. If I were to sacrifice my son’s interests so readily, he would feel hurt, and less secure in my love for him. These feelings are bad in themselves and would probably cause further harm in the long run. By contrast, famine victims who don’t even know me won’t feel slighted by my passing them over so that I can care for my son’s needs. So if we take a sufficiently broad view of things, we can see that being partial to the interests of family and friends is usually optimistic after all.

This sort of reasoning is sometimes correct. When all is said and done, we often get better results when focusing on family, friends, and fellow citizens. But not always. After all, in the tale just told, the long-term result of my not sending famine aid is that some people actually die, whereas my son, though in pain and perhaps resentful of my sending the money abroad, would still be very much alive. From an impartial point of view, the death of famine victims is surely worse than my son’s medical problems. When minimizing harm means giving one’s time or money to strangers, utilitarianism requires that we do so—even if that means sacrificing the important needs of friends and family.

This emphasis on impartiality leads to another problem. We are to count everyone’s well-being equally. But suppose that nearly everyone in a society has a deep-seated prejudice against a small minority group. And suppose, further, that they use this prejudice to defend a policy of enslavement. Depending on the circumstances, it could be that utilitarianism requires that we do so—even if that means sacrificing the important needs of friends and family.

When deciding the matter, we must take all of the harms to the slaves into account. But we must also consider the benefits to their oppressors. Everyone’s interests count equally. Rich or poor, white or black, male or female. So far, so good. But also: ignorant or wise, just or unjust, kind or malicious—everyone’s interests count, equally. If enough people are sufficiently mean and ignorant, then utilitarianism can require that we allow the sufferings they cause. Though such cases are not likely to occur that frequently, they can. And when they do, utilitarianism sides with the oppressors. That is a serious problem for any moral theory.

No Intrinsic Wrongness (or Rightness)

When considering the sort of case just described, it is tempting to fall back on the following view. Certain types of action—think of torture, rape, enslavement—are intrinsically wrong, (i.e., wrong by their very nature). We don’t need to check the results of such behavior in order to know that they are immoral. All we need to know is what such actions are truly like. Armed with this knowledge, we can see that they shouldn’t be done.

Utilitarians cannot accept this. For them, the morality of an action always depends on its results. This feature of the theory is precisely what supports its moral flexibility: any sort of action can be morally right, so long as its outcome is optimistic. Even actions that cause only terrible suffering can be morally right, provided that they manage to prevent even greater suffering. Utilitarianism’s moral flexibility comes from its refusal to absolutely prohibit any kind of action.

Suppose that utilitarianism is correct and there is nothing wrong, in and of itself, with killing innocent people. Usually, of course, such killings will not be optimistic. But imagine a person who is really badly off and whose future is grim. He wants to live, and enjoys some small pleasures every now and then. But most of his life is quite bad, and that’s not going to change. The world would contain less misery if he were to die. And so we must kill him—provided, of course, that we avoid causing even greater harm by doing so. If we were caught, then we would be sent to jail, our own families would suffer; other vulnerable people would become much more
afraid, and so on. But if we can kill this man without being caught, while convincing everyone that he died of natural causes, then utilitarianism tells us that we must do so. This is no murder. It is justifiable homicide. That’s because this man’s life was lowering the overall level of well-being in the world. With him out of the picture, that level rises.

Utilitarians reject any absolute ban on killing innocents (or torturing them, or stealing from them, etc.). This has a very important implication: any kind of action, no matter how awful, is permitted, provided it is necessary to prevent an even worse outcome.

This utilitarian rationale is the one that many truly vicious political leaders have relied on to defend their record. In a candid moment, they might admit to having tortured their opponents, crushed civil rights, allowed their cronies to enrich themselves at the expense of the country. The story is always the same: we are not perfect, but toppling us and allowing our opposition to take over would be even worse. So you must support us.

This is usually nothing other than a lame effort to dignify the ruthless pursuit of self-interest. But sometimes these people are (also) telling the truth. Though their regime is terrible, no viable alternative would be any better. If utilitarianism is correct, then supporting such a government would be morally right. Trying to overthrow it would be immoral.

You might recoil at this. You might think that we should never dirty our hands by supporting evil. Utilitarianism denies this. Life does not always present us with happy choices. We may have to choose between collaborating with evil, or refusing to do so, thereby allowing an even worse outcome to occur. In such cases we must always collaborate, since our ultimate moral duty is to minimize harm. If utilitarianism is correct, no kind of action is always morally beyond the pale.

Utilitarians deny that any type of action is intrinsically wrong. And as they see it, no kind of action is intrinsically right, either. One might think, for instance, that there is something right, in and of itself, about keeping a promise, telling the truth, or helping the needy. But utilitarians deny this. On their view, the merit of an action depends entirely on its results. Any instance of promise keeping, truth telling, or kindness that fails to be optimistic is immoral.

The Problem of Injustice
Perhaps the greatest problem for utilitarianism can be simply put: we must maximize well-being, but sometimes we can do this only by committing some serious injustice. Moral theories should not permit, much less require, that we act unjustly. Therefore, there is something deeply wrong about utilitarianism.

To do justice is to respect rights; to commit injustice is to violate rights. If it is ever optimific to violate rights, then utilitarianism requires us to do so.

Consider two examples from wartime: vicarious punishment and exemplary punishment. Vicarious punishment targets innocent people as a way to deter the guilty. Such a tactic often backfires. But it can sometimes be extremely effective. You might stop terrorists from their dirty work by abducting their relatives and threatening to torture them. You might prevent guerrilla attacks by killing the residents of the villages that shelter them. Though the torture and deliberate killing of innocent civilians certainly infringes their rights, the utilitarian will require that it be done if it prevents even greater harm.

Exemplary punishment is punishment that “makes an example” of someone. I recently came across a good instance of this in E. L. Doctorow’s book The March, a fictionalized account of Sherman’s 1864 march to the sea. At one point in his campaign, Southern guerrillas captured, tortured, and killed some of Sherman’s soldiers while his army was encamped. How to prevent such attacks in future? Sherman had the Southern prisoners of war in his camp brought before him. He selected one at random. Then he had the man publicly shot, and announced that he’d repeat the exercise in the case of future guerrilla attacks. The attacks stopped immediately.

Sherman’s command likely saved more lives than it cost, and so, by utilitarian standards, it was the right thing to do. But it came at the expense of the prisoner’s moral rights. Shooting that prisoner stopped the guerrilla attacks. But that doesn’t mean that the prisoner deserved to die.

Cases of vicarious and exemplary punishment are cases in which people do not deserve to be harmed. There are also many examples in which people do deserve some sort of penalty or punishment, but it is not optimific to give them their just deserts. Think of situations in which a student rightly receives a failing grade, and appeals for a better one. Sometimes it really would be most beneficial to give the student the grade he wants, rather than the grade he has earned. Perhaps a job or a scholarship is on the line. If the benefits outweigh the costs, utilitarianism requires that the professor change the grade.

There are more serious cases. After World War II, U.S. officials determined that it was beneficial to allow many Nazi scientists to escape
punishment, so long as they agreed to share their weapons intelligence. Prosecutors sometimes let acknowledged murderers go free, if the killers testify against the crime bosses who once hired them. Political leaders with blood on their hands are often allowed to retire peacefully, so as to avoid the civil strife that would result were they prosecuted for their crimes. If utilitarianism is correct, then we must minimize harm—even if doing so means letting the guilty escape justice.

It is true that, when rights are violated, victims are usually harmed. So utilitarianism usually condemns injustice. But not always. A bank manager may embezzle millions, and doctor the records to ensure that his theft is never discovered. He and his family may live like kings, and no one be the worse for it. A thief may steal a valuable jewel that its owner has come to hate. Suppose the owner had secretly wanted to be rid of it. The owner's rights have surely been violated, but neither he nor anyone else is the worse for it. In such cases there is only benefit, and little or no harm. Utilitarianism thus approves of such thefts. And yet they were undertaken entirely for selfish reasons, and achieved only selfish gains. These examples, and others offered earlier, should give us pause. A plausible moral theory has to give justice the importance it deserves. It's not clear that utilitarianism can do this.

Potential Solutions to the Problem of Injustice

For as long as utilitarianism has been around, its fans have had to deal with the objection that it shortchanges justice. They have had ample time to develop replies. Let's consider these replies by framing each of them as a response to the Argument from Injustice:

1. The correct moral theory will never require us to commit serious injustices.
2. Utilitarianism sometimes requires us to commit serious injustices.
3. Therefore utilitarianism is not the correct moral theory.

There are four replies that are especially important. We'll consider three of them here, and then devote the next section to the fourth.

Justice Is Also Intrinsically Valuable

This might sound puzzling, but the first reply accepts this argument in every respect. Utilitarianism cannot allow for the independent importance of justice, and that disqualifies it from being a good moral theory. Strictly speaking, then, utilitarianism is false. But if we make a small change to the doctrine, then all will be well.

A defining feature of utilitarianism is its view that well-being is the only thing that is intrinsically valuable. Suppose we amend that, and say that justice is also important in its own right. So we should maximize well-being and maximize justice in the world. That will solve the difficulty.

Or will it? It seems, instead, that we just open ourselves up to the problem aired earlier, in which consequentialism loses its ability to give guidance when promoting one value comes at the expense of another. If we are to maximize happiness and justice, what happens when we can't do both? Which should we give priority to?

We could say: always give priority to justice. But this isn't very plausible. Suppose that there has been gridlock in the state legislature. For months, lawmakers have been unable to pass a spending bill. Finally, a compromise package comes to the floor. If it doesn't get passed, there is no telling when another spending package will be voted on. In the meantime, government will shut down, tens of thousands of people will not receive paychecks, medical assistance, or welfare support. Furthermore, the spending bill looks terrific. It solves a great number of the state's problems, gives aid to the neediest, and sponsors projects that will do genuine good for most communities. There is only one problem—it includes a clause that unfairly denies a small community the agricultural subsidies that the governor had promised it. Still, given the alternatives, a legislator should definitely vote for the spending bill, even though this means a minor injustice. As a general matter, if the stakes are extremely high, and the injustice very small, then it may be right to perpetrate injustice.3

Rather than always giving priority to justice, we might instead always give priority to well-being. But then we are right back to the original theory, and so have made no progress in solving the problem of injustice.

What seems right to say is this: sometimes it's best to prefer well-being to justice, and sometimes not. But without any principle to sort this out, we don't really have a coherent theory at all.

Injustice Is Never Optimific

In the face of this problem, some utilitarians deny premise 2, and so deny that their theory ever requires us to commit injustice. They say that if we

---

3. Everything depends on the details. Much more on this sort of problem can be found in the discussions in chapters 15 and 16.
closely consider all of the results of unfair actions, we will see that those actions aren’t really optimific. A policy of vicarious punishment, for instance, may work in the short run. But it will cause such anger among the target population that an even greater number of them will join with the opposition. And that will mean more innocent bloodshed over time.

Such a calculation is certainly true in many cases. But it is unwarranted optimism to suppose that things will always work out so fortunately. Sometimes, for instance, terror movements do lose support when the surrounding civilian population is forced to take the hit. And there are times when exemplary executions decrease violence over the long run. Injustice can sometimes prevent great harm. It can, on occasion, also produce great benefits. We can’t tell the many stories of the criminals who have gotten away with it, because their happiness depends on their crimes remaining secret. In some of these cases, there is substantial benefit and little or no harm. Utilitarianism must approve of such actions.

**Justice Must Sometimes Be Sacrificed**

A third utilitarian strategy allows that well-being and justice sometimes conflict. But when they do, it is justice, and not well-being, that must take a backseat. Justice is only a part, not the whole, of morality. Of course it is important to respect people’s rights, but that is because doing so is usually optimific. When it isn’t, rights must be sacrificed. So premise 1 of the Argument from Injustice is false.

Utilitarians who defend this strategy know that their recommendations will sometimes clash with conventional wisdom. But as we have seen, this is not a fatal flaw. Received opinion is not the final word in ethics. Utilitarianism began its life as a radical doctrine. That legacy remains.

Utilitarians can claim that our deepest moral convictions, including those that require us to do justice, reflect a utilitarian framework. We are socialized to tell the truth, protect the weak, keep our promises, and so on, **because doing so tends to be optimific.** But when it is not, utilitarians ask us to look at morality’s ultimate standard, and to set aside our ordinary scruples in favor of the principle of utility.

It is a good thing, from a utilitarian point of view, that we are so reluctant to approve of injustice. But as we saw in the previous chapter (pp. 122–23), virtuous motivation can sometimes lead to poor results. When it does, utilitarianism condemns the action as immoral. If, for instance, Sherman’s qualms about injustice had prevented his execution of the prisoner, many more innocent lives would have been lost. If innocent lives are so important, then surely (say utilitarians) we ought to save as many as possible. That sometimes requires us to act unjustly.

Most of us agree that justice can sometimes be outweighed by other moral concerns. If, in a previous example, a legislator must authorize a minor injustice in order to pass an immensely beneficial spending bill, then morality gives the go-ahead. If you can administer CPR to a stricken passerby, and so save his life, then it is worth committing a minor injustice to do so. So justice may sometimes be sacrificed. But when? Utilitarians have an answer: whenever the results of doing so are optimific. If you don’t like that answer, you need to supply a better principle that tells us when injustice is, and is not, permitted.

**Rule Consequentialism**

There is a moral theory that deserves special mention here, because it promises to handle a number of objections to utilitarianism, while keeping much of its spirit. This is the **rule consequentialism**—the view that an action is morally right just because it is required by an optimific social rule.

An optimific social rule is a rule that meets the following condition: if (nearly) everyone in a society were to accept it, then the results would be optimific.

The basic idea is this. Rather than determine an action’s morality by asking about its results, we ask instead about whether the action conforms to a moral rule. This is a familiar model in ethics. Most moral theories operate this way. What distinguishes them from one another are their different claims about what makes something a moral rule. Rule consequentialists have a specific view about this. The moral rules are the optimific social rules.

To know whether a rule is an optimific social rule, follow these three steps:

1. Carefully describe the rule.
2. Imagine what a society would be like if just about everyone in it endorsed the rule.
3. Then ask this question: will that society be better off with this rule than with any competing rule?

If the answer to this question is yes, then this rule is an optimific social rule. If the answer is no, then it isn’t an optimific social rule, and so is not a genuine moral rule.
Let's make this concrete. Return again to the example in which General Sherman orders a captive to be shot. Is that a morally acceptable thing to do? According to rule consequentialism, we answer this question by figuring out the moral rules that govern the treatment of prisoners of war. One of these rules might be: do not execute prisoners of war without a fair trial. Another might be: execute prisoners of war if you think that doing so will be highly beneficial. And of course there are many other candidates. But let's just stick with these two.

The rule consequentialist will ask us to imagine societies that are governed by each of these competing rules. Which society would be better off?

That depends, of course, on what makes societies and their citizens better off. Rule consequentialists differ on this question. Some are hedonists; others are desire satisfaction theorists; still others defend different lists of objective goods.

The most prominent contemporary version of rule consequentialism, that offered by the philosopher Brad Hooker, says that there are two, and only two, things of intrinsic value—happiness and justice. Optimistic social rules will be ones that both increase happiness and respect rights.

So, which of the two rules regarding captured prisoners will, over the long run, maximize both happiness and justice? It is very probably the first rule, which requires captors to try their prisoners fairly. A society governed by the second rule would give too much discretion to commanders, who might make serious mistakes about the benefits of killing their captives without due process. There may be isolated cases in which ordering such a killing is optimistic. But as a general policy, it is probably optimistic to forbid such behavior.

If that is so, then rule consequentialists will condemn Sherman's order. And that is surely what justice requires. Rule consequentialism will probably also instruct professors to give their students the grades they deserve, rather than those they would like to have. It will condemn the actions of thieves, even if they don't get caught and their victims suffer in only minor ways.

You see where this is going. When we focus on what is optimistic as a general policy, we repeatedly get advice that agrees with our notions of justice. Even rule consequentialists who reject the intrinsic value of justice, and insist that well-being is the only thing of ultimate value, will almost always defend policies that are just. That's because in the long run, and as

---

innocent, would forbid torture and embezzlement and vicarious punishment—even when specific instances of such action would be most beneficial. This is self-defeating, since a consequentialist's ultimate aim is to produce the best possible results.

No matter what your ultimate goal is, the rules that generally achieve that goal will sometimes fail to do so. If you know that you are in one of those exceptional situations, then why follow the rule? Suppose that justice, not happiness, is the ultimate value. Suppose, too, that justice would be best served if everyone were to follow a certain rule, such as one that prohibits tampering with evidence. But why follow that rule if you know that this time, unusually, breaking the rule will yield the most justice?

If the ultimate purpose of morality is to make the world a better place, then it is irrational to knowingly behave in ways that fail to do this. And yet that is what rule consequentialism sometimes requires. That is why most consequentialists have rejected it.

Conclusion

Consequentialism is a perennial favorite with moral philosophers. Its emphasis on equality and impartiality, its moral flexibility, its inclusion of animals and less-than-fully autonomous human beings within the moral community, its orientation to the future, and its emphasis on results have great appeal for many ethical thinkers.

But we have also seen that there are worries for consequentialism, and these are not easily solved. We usually admire impartiality, but sometimes think that partiality is what morality demands. The consequentialist promise of being able to offer concrete advice to solve moral conflicts may be unfulfilled. Consequentialism can require a degree of self-sacrifice that strikes many people as extreme. It sometimes demands that we perform some truly awful actions, so long as they are needed to prevent even greater horrors. And it sometimes calls on us to commit injustice. We considered four solutions to this last problem, none of which seemed wholly satisfying.

It is fitting, then, that we now turn to a competing view that gives pride of place to justice: the theory of Immanuel Kant.

Discussion Questions

1. Is there any way of measuring how much happiness is brought about by an action? Do we have any method for comparing the happiness of two different people? If the answer to these questions is "no," is this a problem for utilitarianism?
2. Do you think that utilitarianism is too demanding? Why or why not?
3. Utilitarianism requires us to be impartial. What does this amount to? In what sense does utilitarianism require that we treat all people equally? Is this a positive or a negative feature of the theory?
4. Which utilitarian reply to the Argument from Injustice do you think is the most promising? Do you think that this reply is ultimately successful? Defend your answer.
5. What is rule consequentialism? How does the theory deal with the problem of injustice that threatens act utilitarianism? Do you find rule consequentialism to be a plausible ethical theory?
Imagine a person who reasons as follows: I should keep my money rather than pay it out in taxes, because if I keep it, I'll be able to afford a wonderful vacation for myself and my family. And no one is actually going to suffer if I pocket the money, since it's only a few thousand dollars that we're talking about. There's no way that money could bring as much happiness in the government's hands as it could in mine.

Suppose he is right about that. He spends the money on his vacation. He and his family have a terrific time. He is never caught.

Still, he has done something wrong. So has the person who cheats on her exams and gets away with it. So has the person who gleefully speeds down the emergency lane and escapes the traffic jam that the rest of us are stuck in. So has the person whose campaign of dirty tricks has gotten him securely into office.

Despite any good results that may come from their actions, these people did wrong—or so we think. And the explanation of their immorality is simple. What they did was unfair. They took advantage of the system. They broke the rules that work to everyone's benefit. They violated the rights of others. No matter how much personal gain such actions bring, they are still wrong, because they are unfair and unjust.

Immanuel Kant (1724–1804) thought this way, and was very likely the most brilliant philosopher ever to have done so. He remains perhaps the most important voice of opposition to utilitarianism, and to its claim that the ultimate point of morality is to improve well-being rather than do justice.

Consistency and Fairness

There is a natural way to understand what is wrong with the actions in the examples just given. In each case, people are making exceptions of themselves. Their success depends on violating rules that most other people are following. This is a kind of inconsistency—of playing by one set of rules while insisting that others obey a different set.

People are inconsistent to the extent that they treat similar cases differently. Tax cheats or dirty politicians are in the same boat as the rest of us. There's nothing special about them, or their situation, that exempts them from the rules that everyone must follow. That you can get away with making an exception of yourself doesn't mean that it is right to do so.

Our deep opposition to unfairness, and the resulting importance we attach to consistency, are revealed in two very popular tests of morality. Each takes the form of a question:

1. What if everyone did that?
2. How would you like it if I did that to you?

When we ask such questions—in the face of a bully, a liar, or a double-crosser—we are trying to get the person to see that he is acting unfairly, making an exception of himself, living by a set of rules that work only because others are not doing what he is doing. These basic moral challenges are designed to point out the inconsistency, and so the immorality, of that person's behavior.

Consider the first question: what if everyone did that? This question is really shorthand for the following test: if disastrous results would occur if everyone did X, then X is immoral. If everyone used the emergency lanes in traffic jams, then ambulances and fire trucks would often fail to provide needed help, leaving many to die. If everyone cheated on their taxes, society would crumble. If every candidate resorted to dirty tricks, then the entire political system would become corrupted. The test works easily and well for these cases.

But the test fails for other cases, and so it cannot serve as a reliable way to learn the morality of actions. Consider a common argument against homosexual sex: if everyone did that, disaster would soon follow, for the human race would quickly die out. Even if this were true, that wouldn't show that homosexual sex is immoral. Why not? Well, consider those who have decided to remain celibate—perhaps they are priests, or committed lifelong bachelors who believe that one shouldn't have sex without being
married. What if everyone did that—in other words, refrained from having sex? The same results would follow. But that doesn't show that celibacy is immoral.

The real problem for this test, apart from the fact that it sometimes delivers mistaken verdicts, is that it makes the morality of an action depend on how it is described. Suppose the sexual relations of a gay couple were described as their having consensual, enjoyable sex. In that case, their actions would pass the test. But that undermines the test, because it shows that the test yields contradictory results. The very same action is said to be both morally wrong and morally acceptable, depending only on how it is described. Without any independent guidance on how to select one description over another, this test cannot do the job it was supposed to do—namely, identify which acts are immoral.

What about the other test, the one that asks: How would you like it if I did that to you? This is a direct application of the golden rule, which tells you to treat others as you would like to be treated. The golden rule is the classic test of morality. Clearly, it is meant to be a test of consistency. If you wouldn't want to be slandered or exploited, then don't do such things to others. If you do them anyway, you are acting inconsistently, hence unfairly, and therefore immorally.

Getting people to imagine what it would be like to switch places with their intended victims is often a very effective way to convey a moral message. That is why films and literature are often such powerful tools of moral education. But imaginatively filling someone else's shoes, and asking yourself whether you'd accept being treated in a certain way, is actually an unreliable test of morality. The golden rule cannot be correct.

Kant himself identified the basic reason for this. The golden rule makes morality depend on a person's desires. Most of us don't like to be hit. And so the golden rule forbids us from hitting others. Good. But what about masochists who enjoy being hit? The golden rule allows them to go around hitting others. That's bad. The morality of hitting people shouldn't depend on whether you like to take a beating every now and then.

Consider a related problem, that of the fanatic. Fanatics are principled people. It's just that their principles are ones that we find frightening and revolting. Some fanatics are so wedded to their cause, so strong-willed and self-disciplined, that they would accept the suffering that they want to impose on their victims, were the role of victim and persecutor reversed. True, few Nazis, for instance, would really accept a march to the gas chamber were they to discover their Jewish ancestry. Most Nazis, like most fanatics generally, are opportunists of bad faith, ones with very limited empathy and only a feeble ability to imagine themselves in someone else's place. If roles really were reversed, they'd much more likely beg for mercy and abandon their genocidal principles. But some would not. There are true believers out there who are willing to suffer any harm in the name of their chosen cause. The golden rule licenses their extremism because it makes the morality of an action depend entirely on what you want and what you are willing to put up with.

The golden rule also fails to give us guidance on self-regarding actions (i.e., those that concern only oneself). That's not a problem for most people these days, since it's now unusual to think that we owe moral duties to ourselves. But in Kant's time, self-regarding duties were widely endorsed, and many people still think, for instance, that there is something immoral about suicide or about letting one's talents go to waste, even if no one else is harmed in the process.

Because the golden rule sometimes gives the wrong answer to moral questions, it cannot be the ultimate test of morality. Something else must explain why it works, when it does. Kant thought he had the answer.

**The Principle of Universalizability**

Kant, like most of us, felt the appeal of the two tests just discussed. He agreed that common sense is deeply committed to the importance of fairness and consistency, something that these two tests were trying, but not quite succeeding, in capturing. His aim was to identify the ultimate principle of morality, one that would explain the attraction of the two tests while correcting for their shortcomings.

He thought he had found it in the following standard, the principle of universalizability:

> An act is morally acceptable if, and only if, its maxim is universalizable.

To understand what this means, we need to understand two things: what a maxim is, and what it is for a maxim to be universalizable.

A maxim is simply the principle of action you give yourself when you are about to do something. For instance, if you send a regular check to Oxfam, your maxim might be: contribute fifty dollars per month to Oxfam to help reduce hunger. A maxim has two parts. It states what you are about
to do, and why you are about to do it. You dictate your own maxims. These are the rules you live by.

Kant thought that every action has a maxim. Of course we don't always formulate these maxims clearly to ourselves prior to acting, but at some level, whenever we act, we intend to do something, and we have a reason for doing it. A maxim is nothing but a record of that intention and its underlying reason. Maxims are what we cite when we try to explain to others why we act as we do.

If we lack a maxim, then we aren't really acting at all. We could be moving our bodies, as we do when we sneeze or roll across the bed in our sleep. But the absence of a maxim in these cases shows that these are mere bodily movements, rather than genuine actions.

Kant thought that an action's rightness depends on its maxim. And this leads directly to a very important point. For Kant, the morality of our actions has nothing to do with results. It has everything to do with our intentions and reasons for action, those that are contained in the principles we live by. This is a clear break with consequentialism.

Indeed, we can imagine two people doing the same thing, but for different reasons. That means that they will have different maxims. And even if their actions bring about identical results, one of the actions may be right and the other wrong, since only one of the maxims may be morally acceptable. This is something that act consequentialists cannot accept.

It might be, for instance, that I keep my promises to you because I think it's right to do so. But I might instead keep my promises because I want you to like me so much that you leave your fortune to me in your will. Assume that these different reasons don't change the results of keeping my promises. Then the utilitarian thinks that each case of promise keeping is equally good. But since my maxim is different in these cases, Kant thinks that the morality of these actions might be different. It all depends, as we'll shortly see, on whether their maxims are universalizable.

Many people agree with Kant's view that the morality of our actions depends not on their results, but on our maxims. This supports our thought that those who set out to do evil are acting immorally, even if, through sheer chance, they manage to do good. It also justifies the claim that people who live by noble principles are acting morally, even when some unforeseeable accident intervenes, and their action brings only bad results.

Kant had a deep reason (discussed in detail in the next chapter) for making the morality of an action depend on its maxim, rather than its results: it is crucial that the morality of our actions depends entirely on what is within our control. We can control which maxims will govern our actions. We decide for ourselves what we intend to do. Even in cases where my options are severely limited, as when a thug has a gun at my head, it is up to me to decide which choice to make.

By contrast, the results of our actions are often out of our hands. We can't always control them. And it is unfair to assign credit or blame for things we can't control. That is why we have an insanity defense. That is why we don't prosecute animals for the damage they sometimes cause. That is why we don't condemn infants for any harm they do.

So the morality of actions depends on their maxims. But how, precisely? Not every maxim is going to be a good one. We need a way to sort out the good maxims from the bad. That's where universalizability comes in.

How can we tell whether a maxim is universalizable? Here is a three-part test:

1. Formulate your maxim clearly—state what you intend to do, and why you intend to do it.
2. Imagine a world in which everyone supports and acts on your maxim.
3. Then ask: Can the goal of my action be achieved in such a world?

If the answer to this last question is yes, then the maxim is universalizable, and the action is morally acceptable. If the answer is no, then the maxim is not universalizable, and the action it calls for is immoral.

This should strike a familiar note. The test of a maxim's universalizability clearly echoes the rule consequentialist's test for optimific social rules (see the previous chapter), and the what if everyone did that? test discussed above. Indeed, Kant has us ask a version of that question in the second step of this three-part test. But unlike these other tests, Kant doesn't ask about whether people would be much better off in the imagined world, or about whether disaster would strike there. Instead, he asks about whether we could achieve our goals in that world. But what is so important about that?

The importance, for Kant, is that this three-part test serves as the real way to determine whether we are being consistent and fair. If our maxim is universalizable, then we are pursuing actions for reasons that everyone could stand behind. We are not making exceptions of ourselves. Our goals are ones that everyone could support, even if, in the real world, some are dead set against them. We are asking whether our aims could be achieved if everyone shared them. If they can be, this shows that we are living by fair
rules. Were we making an exception of ourselves, our maxims wouldn't be universalizable.

Consider the tax cheat again. The only reason he can get what he is aiming for (a lovely vacation) is because enough others are not adopting his maxim. The same goes for the careless driver who speeds down the emergency lane.

Kant sought to make this point with an example of his own. (I am embellishing a bit, but the essence of the example is Kant's.) Suppose that I am a compulsive gambler who is constantly in debt. One night I go to the tables to recoup my losses, only to dig myself further in the hole. The casino boss is having his men drop by tonight to collect. I can either pay them or have my kneecaps broken. I know which one I'd prefer.

The problem is, I don't have the money, the bank won't lend me any more, and I don't have anyone to turn to but you. Since you are aware of my reputation, I know that the only way to get the money is by lying to you. So, I beg and plead and promise you, by all I hold dear, that I will repay you—even though I have no intention of doing so. I have just made what Kant calls a lying promise.

It seems clear that what I am about to do is immoral. And that is true even if, through a minor miracle, I then feel so much guilt that I repent of my ways, transform myself, and make the lie turn out for the best in the end. The morality of the action doesn't depend on its results, but on its maxim. And my maxim here is not universalizable. So my action is immoral, as Kant says, and as we believe.

Here's why. Suppose my maxim is: lie to a friend, in order to escape from being hurt. And suppose everyone acts on this maxim. They lie whenever they think that it is necessary to avoid some personal harm. In that situation, no one would trust the promises of others. And without that trust, people could not achieve the goals they are aiming for with their promises. In a world where no one believed the promises of others, I'd never be able to get money from you with my promise. And so the purpose of my promise would be defeated. And so my maxim is not universalizable. I am making an exception of myself, and am treating you unfairly. My action is therefore immoral.

Morality and Rationality

Kant claimed that when we act on a maxim that can't be universalized, we are contradicting ourselves. We are being inconsistent. We are assuming that it is acceptable to act in a certain way, even though our purposes could not be achieved if others acted in that very same way. When we make an exception of ourselves, we are acting as if we were more important than anyone else, and going on as if we were exempt from rules that others must obey. But we are not more important than others, and we are not exempt from these requirements.

It follows that when we behave immorally, we are reasoning badly. We are making mistaken assumptions—that we are more important than other people, that the rules applying to them do not apply to us. Those mistakes, and the inconsistent, contradictory reasoning behind them, show that immoral conduct is irrational.

That is a very striking claim, and one that most of us hope is true. We want to be able to convict rapists or terrorists of irrationality, of ignoring their strongest reasons. We want to be able to truthfully say that there were excellent reasons for them to do good and to avoid evil. Kant believed that we could do this.

But how could Kant be right? Consider the ruthless contract killer who knows precisely what he wants, knows exactly how to get it, and executes his plan without fail. Morality doesn't enter into his calculations. He knows that what he is doing is immoral, but that doesn't faze him. It seems that such a person is reasoning flawlessly. How can we defend the claim that he is irrational?

Let's call this the Amoralist's Challenge. The amoralist is someone who believes in right and wrong but doesn't care about morality at all. The amoralist has the same attitude to moral rules as I do to the rules of professional cricket—yes, they really exist, but they have absolutely no bearing on my life. Obedience to these rules is completely optional. If I am interested in playing the game, then I'll follow the rules. If not, then there is no reason to do so.

The Amoralist's Challenge supports this view in the following way:

1. People have a reason to do something only if doing it will get them what they care about.
2. Doing their moral duty sometimes fails to get people what they care about.
3. Therefore, people sometimes lack any reason to do their moral duty.
4. If people lack any reason to do their moral duty, then violating their moral duty can be perfectly rational.
5. Therefore, it can be perfectly rational for people to violate their moral duty.
The success of this argument would undermine the thought that morality, all by itself, supplies us with good reason to do as it says. It would also refute Kant's claim that immoral actions are always irrational.

Kant thought that you act irrationally when you act contrary to your strongest reasons. And he thought that when moral reasons apply to a given situation, they are always the strongest reasons. Moral reasons are more important than any other kind of consideration. If morality requires you to do something, then that is what you must do—even if you don't want to do it, even if you'll suffer for doing it, and even if the results of doing it are generally disastrous.

Kant admits that the ruthless contract killer, like so many other successful criminals, did, in a sense, reason perfectly well. He followed what Kant called hypothetical imperatives. Specifically, these imperatives (commands) are commands of reason. They command us to do whatever is needed in order to get what we care about. Hypothetical imperatives tell us how to achieve our goals. They require us, on pain of irrationality, to do certain things, but only because such actions will get us what we want.

For instance, if my goal is to lose twenty pounds (as it often is), then reason requires me to forgo that pint of luscious coffee ice cream. If I want to get that Wall Street job, then reason requires that I line up a good summer internship. Reason demands that I look both ways at a busy intersection if I want to remain alive. These rational commands apply to me because of what I care about. I am irrational if I disregard them or act in a way that violates them.

But what if I decide that I don't care about weight loss or the benefits that weight loss can bring? What if I don't care about a Wall Street job? What if I want to die rather than live? In that case, I am no longer rationally required to pass on the ice cream, get the internship, or look both ways before crossing the street. These commands of reason are precarious. Their existence depends entirely on what I want. When my desires change, these rational requirements change or disappear.

Many people think that all rational requirements are like this—that they are all hypothetical imperatives. That's precisely what the first premise of the Amoralist's Challenge states: all of our reasons for action depend on what we care about.

Kant saw the implications of this argument very clearly, and knew that he had to challenge that first premise. In his jargon, what we need is to show how there can be such a thing as a categorical imperative. This is also a command of reason. But unlike hypothetical imperatives, categorical imperatives are rational requirements that do not depend on what we care about. They are requirements of reason that apply to everyone who possesses reason—in other words, everyone able to reflect on the wisdom of her actions, and able to use such reflections to guide her actions. Categorical imperatives command us to do things whether we want to or not, with the result that if we ignore or disobey them, we are acting contrary to reason (i.e., irrationally).

Kant thought that all moral duties are categorical imperatives. They apply to us just because we are rational beings. We must obey them even if we don't want to, and even if moral obedience gets us nothing that we care about.

One lesson Kant took from his thoughts about the golden rule is that the basic rules of morality do not depend on our desires. If they did, then moral rules would fail to apply to everyone, since our desires can differ from person to person. This would make morality too variable, and make it impossible for people to escape from their moral duty just by changing what they want. Kant thought that he was defending common sense when he claimed that morality is, in this sense, universal—that everyone who can reason must obey its commands.

If moral duties really are categorical imperatives, then we act rationally when we act morally, and we act irrationally when we act immorally. Is that sort of view defensible? Can we really justify the claim that it is rational for everyone to act morally—even if we know that, for some people, moral conduct will only undermine their goals?

Kant thought he could do this. Consider his Argument for the Irrationality of Immorality:

1. If you are rational, then you are consistent.
2. If you are consistent, then you obey the principle of universalizability.
3. If you obey the principle of universalizability, then you act morally.
4. Therefore, if you are rational, then you act morally.
5. Therefore, if you act immorally, then you are irrational.

It does seem that rationality requires consistency, as the first premise asserts. And, as we have discussed, the principle of universalizability is a demand of consistency. So, while more could certainly be said about these first two premises, let us take them for granted here and focus on the third. This is the claim that obedience to the principle of universalizability guarantees that our conduct is moral.

Its location in this argument tells us that the principle of universalizability is a crucial element in Kant's reply to the Amoralist's Challenge. He needs
to successfully defend the principle in order to secure the claim that rational people are moral people, and immoral people are irrational. Can he do it?

Assessing the Principle of Universalizability

Unfortunately, the principle of universalizability fails as a general test for the morality of our actions. Look at premise 3 of Kant's Argument for the Irrationality of Immorality. It says that a maxim's universalizability is a guarantee of an action's rightness. That is false. We can act on ununiversalizable maxims and still do wrong.

The principle of universalizability seems to be a very attractive way of pointing out how unfairness and inconsistency lead to immorality. So, for instance, when a thief robs a bank in order to gain riches, Kant can show why his action is immoral. If everyone acted on that maxim, there would be no money in the bank to steal, and the thief's goal could not be achieved. But what if the thief had robbed the bank in order to cripple it and put it out of business? If everyone acted that way, then the thief's goal could be achieved. So the principle of universalizability fails to condemn the robbery. And yet such an act is surely wrong.

Suppose that someone wants nothing more than to have a picture-perfect lawn. His basic maxim is to do whatever it takes to preserve the beauty of his grass. This would be strange, but that is no strike against his plans. The real thorn in this guy's side is the mail carrier, who always trots across the lovely yard on his way to delivering the mail. He has been warned, repeatedly, to use the sidewalk—but he never listens. So the homeowner decides to take matters into his own hands. The next time the mailman walks across the lawn, the homeowner pulls out a gun and kills him.

That's clearly the wrong thing to do. But this man's maxim is universalizable. It tells him to take whatever steps are necessary (including killing) in order to preserve the beauty of his lawn. What if everyone were to act upon this maxim? Could the homeowner's goal be met? Undoubtedly. And so, if the principle of universalizability is true, this is no murder; it is justifiable killing. That has to cast serious doubt on the principle.

This unlikely example is just an instance of a general problem, one that we have seen before. Recall the case of the fanatic that came up when we were discussing the what if everyone did that? test. The goals of fanatics are ones that can often be met in a world in which everyone shares their aims. Fanatics (such as the lawn fanatic) need not make exceptions of themselves. The murderous aims of any number of groups could easily be achieved in a world in which everyone supported them. Thus fanatics can be consistent in the relevant sense: their guiding principles could be fulfilled if everyone else were to adopt them.

I think this shows that the principle of universalizability fails to give us an adequate test of fairness, for we can follow its advice while still singling out individuals or groups for discriminatory treatment. There can be consistent Nazis, after all. It doesn't follow that their policies are fair or morally acceptable.

Integrity

While utilitarians think of benevolence (the steady commitment to do good for others) as the central moral virtue, Kant touts integrity. Having integrity is living in harmony with the principles you believe in. It is the virtue of consistency. Integrity requires that you resist making an exception of yourself. It demands that you follow your principles even when doing so comes at a real cost. Kant is surely right that there is something admirable about integrity.

But integrity is not the only moral virtue, and it isn't even the most important one. The example of the fanatic shows this. We may be absolutely dedicated to our principles, but if those principles are deeply flawed, it would be better, morally speaking, for us to have less integrity. That's surely what we want of the Nazi commandant or the dedicated terrorist. It would be better were they less principled people. We want them to be more flexible, and more open to the possibility that their guiding ideals are mistaken. When Huck Finn beats himself up for continuing to hide Jim, the escaped slave who accompanies him down the Mississippi, we applaud Huck's lack of integrity. A Huck with greater integrity is also one who would betray Jim's location. We want Huck to be less than fully conscientious, since that will mean Jim's freedom.

Integrity is worthy of our admiration only when it is tied to morally legitimate principles. The problem, as we have seen, is that people of integrity may still be doing wrong. Refusing to make an exception of myself is no guarantee that my principles are morally acceptable. It's not that consistency is worthless. But it fails as a general test for the morality of the principles we live by.

Kant on Absolute Moral Duties

Kant thought that certain sorts of actions are never permitted. Lying is one of them. In a much-discussed case, that of the inquiring murderer, Kant
has us imagine a man bent on killing. This man knocks at your door and asks if you know the location of his intended victim. You do. Should you reveal it? If you do, your information is almost certainly going to lead to murder.

Kant thought you had two decent choices. Ideally, you'd just say nothing. That wouldn't help the murderer, and it wouldn't involve lying. But what if you have to say something? In that case, you have to tell the truth—because you must never lie, under any circumstances.

I think that this is the wrong answer, and the interesting thing is that Kant's own theory does not require him to give it. Kant was so convinced that lying was wrong that he misapplied his own theory.

Kant never provided an argument for the claim that the moral rules that prohibit such things as lying and killing are absolute (i.e., never permissibly broken). The closest he came to supplying such an argument was in his belief that moral considerations are more important than anything else. In any conflict between moral duty and other demands—say, those of the law, self-interest, or tradition—morality wins.

Still, it doesn't follow that moral duties are absolute, for even if they always outweigh other kinds of considerations, moral duties might conflict with other moral duties. And if they do, they can't all be absolute. Some of them must give way to others.

And can't moral duties conflict with one another? It seems, for instance, that there is a duty to avoid hurting people's feelings, a duty not to start a panic, and a duty to protect innocent people from dangerous attackers. It also seems that fulfilling each of these duties will sometimes require us to lie, and that there is a moral duty not to do so. Perhaps none of these is really a moral duty. Or perhaps, implausibly, we'd never need to lie in order to respect these duties. But it's much more likely that these are real duties, and that they really can conflict with one another. And if that is so, then these duties cannot all be absolute.

This does not spell disaster for Kant. He does not need to defend the existence of absolute moral duties. His philosophy can, for instance, justify lying to the inquiring murderer. Kant's hatred of lying made him overlook a crucial element of his own view—namely, that the morality of action depends on one's maxim. He just assumed that anyone who lied would be operating with a maxim like this: tell a lie so as to gain some benefit. That maxim is not universalizable. In a world in which everyone did this, no one could trust the words of others, and people would be unable to obtain any of the goals they were trying to achieve through lying.

But Kant's maxim is not the only one you could have in such a situation. A maxim is a principle that you give yourself. No one forces it on you. When confronted with a potential killer, I might adopt this maxim: say whatever I need to say in order to prevent the murder of an innocent person. That maxim is universalizable. The goal I am aiming for—to save an innocent person's life—could be achieved if everyone acted this way.

For Kant, we can't determine whether an act is right or wrong until we know its maxim. And for any given action, there are countless maxims that might support it. After all, we make up our own maxims, and mine may be very different from yours. It follows that there is only one way for Kant to absolutely ban a type of action. And that is to be sure in advance that, of all the hundreds or thousands of maxims that might support an action, none of them is universalizable. It is hard to see how we could ever know that.

As a result, it is much harder than Kant thought to defend the existence of absolute moral duties. And in this particular case, that is all to the good, since it opens up the possibility that it is sometimes acceptable to lie—for instance, to the inquiring murderer. Of course, if Kant is right, then we would have to have a universalizable maxim that permits this. But nothing Kant ever said should make us think that this is impossible. Contrary to Kant's personal view, we don't have to regard all (or perhaps any) moral duties as absolute.

**Discussion Questions**

1. What is a maxim, and what does it mean for a maxim to be universalizable? How does the principle of universalizability differ from the golden rule?
2. According to Kant, it is always irrational to act immorally. What reasons does he give for thinking this? Do you agree with him?
3. What is the difference between hypothetical and categorical imperatives? Why did Kant think that morality consists of categorical imperatives?
4. Why does the existence of fanatics pose a challenge to Kant's moral theory? How do you think that the Kantian should respond to this challenge?
5. Is integrity always a virtue? Why or why not?
Is there anything wrong with slavery?

This probably sounds like an idiotic question. Of course slavery is wrong. So let me rephrase my question. Is there anything wrong, in and of itself, with enslaving other people?

In practice, slavery has always created much more harm than good. But what if that were not the case? What if the members of a slave society—slaves as well as masters—were, on the whole, wealthier, better educated, healthier, and better satisfied with their lives than most members of a free society? And what if the abolition of slavery was sure to undercut these greater benefits? In those circumstances, would slavery still be wrong?

This thought experiment was put to readers by an important twentieth-century moral philosopher, Richard Hare. In his article “What Is Wrong with Slavery,” Hare defended the utilitarian view that denied that slavery is intrinsically wrong. Everything depends on the actual results of a slave system; in the imagined example, Hare had to admit that the slave society, since it created greater overall benefits, was the morally superior option. This despite the fact that Hare was once a slave himself. As a British soldier in World War II, he was captured by Japanese forces and interned in a camp that enslaved its inmates.

Hare emphasized that his views did not permit any slave system as actually practiced. He presented the story as a way to show that there is nothing intrinsically wrong with slavery. The utilitarian says that the morality of slavery, like that of any other practice, depends entirely on its results. In the picture Hare paints, slavery can be morally acceptable.

You might be outraged at such a view, convinced that slavery can never be morally right, because it grossly violates people's autonomy. Slavery allows people to be treated as mere things—as objects without any rights, of no intrinsic importance.

This is precisely the Kantian objection to slavery. Morality requires us always to treat human beings with the dignity they deserve. Slavery is inherently disrespectful. No one deserves such treatment. That is what explains why slavery is wrong.

Intuitively, this makes good sense. But it requires a bit of work to unpack it. We need to better understand why treating people as they deserve is so important, and what it means, specifically, to say that we deserve dignity and respect.

The Principle of Humanity

In the course of his work, Kant identified a number of different candidates for the role of ultimate moral principle. While the principle of universalizability clearly emphasizes the moral importance of fairness, another of Kant's formulations directs our attention to the respect and dignity that serve as the basis of morality. This formulation is widely known as the _principle of humanity._

Always treat a human being (yourself included) as an end, and never as a mere means.

To understand this principle, we need to get clear about three things: humanity, ends, and means.

When Kant spoke of _humanity_, he wasn't thinking necessarily of _Homo sapiens_. Rather, he was referring to all rational and autonomous beings, no matter their species. Perhaps there are aliens, or some non-human animals, who are rational and autonomous. If so, then they count as human beings for purposes of Kant's principle.

Treating someone as an end is treating her with the respect she deserves. Treating someone as a means is dealing with her so that she helps you achieve one of your goals. This may be perfectly okay. I do this, for instance, when I hire a plumber to fix a broken water pipe in my kitchen. In an innocent sense, I am using him—he is needed to get me what I want (a functioning sink, in this case). Yet if I greet him at the door, give him any

---

help he asks for, and then pay him as he leaves, I am also treating him with respect, and so, in Kantian terms, I am also treating him as an end.

But what if, while the plumber is checking the leak, I remove a wrench from his tool kit and whack him over the head with it? He's out cold—excellent. I then snugly fit his head into the space where the pipe has corroded, thus plugging the leak. While he's unconscious, I rush off to the hardware store and buy a cheap bit of PVC pipe. The plumber wakes up just as I am returning from the store. I scold him for falling asleep on the job, and usher him out the door with a curt good riddance. Then I proceed to fix the leak myself, saving a hefty fee.

What has happened in this ridiculous scenario is that I've used the plumber literally as a thing, as a piece of pipe. He might as well have been an inanimate object. I failed to treat him in a way that recognized any of his distinctively human features. That's why I have treated him as a mere means.

While it often happens that people do treat one another both as an end and as a means, one can't treat people both as an end and as a mere means. Treating someone as an end implies a degree of respect that is absent when treating someone as a mere means.

Most of us think that there is something about humanity that lends us dignity and makes us worthy of respect. Most of us also think that human beings are worthy of greater respect than anything else in creation. Humans are more important than monkeys or sharks or daffodils or amoebas. Is this a defensible position, or is it just a self-interested prejudice?

Kant had an answer. He claimed that we are each rational and autonomous, and that these traits are what justify our special moral status. These two powers make us worthy of respect. Being rational, as we have seen, involves using our reason to tell us how to achieve our goals and to determine whether we can pursue them in a morally acceptable way. It takes a lot of brainpower to be able to formulate your goals, to imagine a world where everyone pursues them as you do, and then to ask about the consistency of your actions. Human beings are the only species on earth that can engage in such complex reasoning.

Being autonomous literally means being a self-legislator. Autonomous people are those who decide for themselves which principles are going to govern their life. You are an autonomous person. You possess the ultimate responsibility for the choices you make, the goals you aim for, and the manner in which you pursue them. You are not a slave to your passions; you can resist temptation, check your animal urges, and decide for yourself whether to indulge them. You are not forced to act as you do, but are free to choose your own path.

Kant thought that our rationality and autonomy made each of us literally priceless. Despite the work of actuaries, and juries in wrongful death suits, you can't really put a dollar figure on a human life. The assumption that we are infinitely valuable explains the agony we feel at the death of a loved one. If we had to choose between the destruction of the most beautiful art object in the world and the killing of a human being, we should choose the former. No matter how valuable the object, the value of a human life exceeds it by an infinite amount.

The Importance of Rationality and Autonomy

Kant argues that rationality and autonomy support the dignity of each human being, and that everyone is owed a level of respect because of these traits. This makes excellent sense of a number of deeply held moral beliefs. Here are the most important of them.

1. It explains, in the first place, the immorality of a fanatic's actions. Such people don't regard human life as infinitely precious, but rather treat their despised opponents as mere obstacles to the achievement of their goals. The principle of humanity forbids such behavior, even when it is consistently undertaken, and thus allows us to address the most severe problem facing the principle of universalizability.

2. The importance of autonomy explains why slavery and rape are always immoral. Slavery treats the oppressed without regard for their own goals and hopes. Rape is treating another human being solely as a source of one's own gratification, as if the victim had no legitimate say in the matter. These are the most extreme examples of duress and coercion. They are immoral because of their complete denial of the victim's autonomy. As such, these crimes are perhaps the clearest cases of treating other people as mere means.

3. The principle of humanity easily explains our outrage at paternalism. To be paternalistic is to assume the rights and privileges of a parent—toward another adult. Paternalism has us limit the liberty of others, for their own good, against their will. It is treating autonomous individuals as children, as if we, and not they, were best suited to making the crucial decisions of their lives.

It is paternalistic, for instance, if a roommate sells your TV set because he is worried about your spending too much time watching Seinfeld reruns and too little time on your homework. Or imagine a classmate who thinks that your boyfriend is bad for you, and so writes him a nasty note and forges your signature, hoping that he'll break off your relationship.
Anyone who has experienced paternalistic treatment knows how infuriating it can be. And the reason is simple: we are autonomous and rational, and the ability to create our own life plan entitles us to do so. We ought to be free to make a life for ourselves, even if we sometimes make a mess of things.

4. Our autonomy is what justifies the attitude of never abandoning hope in people. The chances that a very hard-hearted man will change his ways may be very small, but the probability never reduces to zero. No matter how badly he was raised, or how badly he has lived his life, he is still autonomous, and so can always choose to better himself. It is usually naïve to expect such a transformation. Changing your character and habits is hardly easy. But the possibility of redemption is always there, and that is only because we are free to set our own course in life.

5. Many people believe in universal human rights. These are moral rights that protect every human being from certain kinds of treatment and entitle each of us to a minimum of respect, just because we are human. Kant can explain why we have such rights. We have them because of our rationality and autonomy. These two traits are the basis for living a meaningful life. If you doubt this, just imagine a life without them. It is a life fit for an insect, or a plant. What endows our life with preciousness is our ability to reason and choose for ourselves how we are going to live it. Every person is rational and autonomous to some degree, and every person needs these powers protected in order to have the sorts of experiences, engage in the kinds of activities, and support the sorts of relationships that make life worth living. Human rights protect these powers at a very fundamental level.

6. Our autonomy is what explains our practices of holding one another accountable for our deeds and misdeeds. Because we are not robots, but rather free and rational human beings, we are morally responsible for our choices and actions. We are fit for praise and blame, and that is because our conduct is up to us. We don't blame sharks or falcons for killing their prey; neither do we condemn a wilted orchid or a nasty-smelling ginkgo tree. Plants and animals deserve neither credit nor blame, and this is because their lives are not autonomous ones.

7. Relatedly, most people believe that punishment, rather than conditioning, is the appropriate response to serious wrongdoers. When dogs “misbehave,” we don’t try to reason with them. We try to condition them to change their behavior through a set of rewards and punishments. They don’t deserve to be punished when they break our rules, and that is because they lack the power to change their behavior by reasoning about it. By contrast, humans do sometimes deserve to be punished, precisely because they could have chosen to act well, but decided to act badly instead. People also deserve not to be manipulated into becoming obedient citizens. If we want criminals to behave differently, we must still respect their autonomy. The importance of autonomy explains why it is so objectionable to brain-wash people, or to drug or torture them into doing what we want.

The Good Will and Moral Worth

Kant's insistence on the importance of rationality and autonomy led him to a view of intrinsic value that is very different from that of consequentialists. The structure of consequentialist thought is simple. Identify what is worth pursuing for its own sake; your moral duty is to maximize this value. Kant rejected this picture in every way.

Kant rejected the idea that happiness (or well-being in any form) is the ultimate value. Happiness has no value, he said, if it comes as a result of wrongdoing. (The enjoyment that a sadistic killer brings to his task does not add value to his crime, but only makes it worse.) And the same goes for other possible values. Wealth can be misused; so can power, and health, and understanding, and bravery. None of these is always valuable. There is only one thing that is valuable, no matter what—only one thing whose presence in any situation is bound to add value to it. That one thing is the good will.

The good will has two parts. It is the ability to reliably know what your duty is, and a steady commitment to doing your duty for its own sake. The good will works in a familiar way: we see what we are morally required to do, and we do it for that very reason. No calculations of costs and benefits, no worries about what impression we might be making, what enemies we might be gaining, what riches might be in store for us. Once we understand where our duty lies, we do it straightaway.

Kant had some very interesting ideas about how the good will worked. Two of these ideas are especially important. Kant thought, first, that acting from the good will is the only way that actions can be truly praiseworthy. (Kant referred to such actions as those that possessed moral worth.) He also thought that acting from such a motive is entirely an exercise of reason.

Consider the first point. Kant has us imagine two shopkeepers, each of whom does his duty by giving his customers the correct change. But the first does this only because he fears that if he were to cheat them, word would get out and he would lose business in the long run. He does his duty, but there is nothing morally worthy about his behavior.
The second store owner does the very same thing, but for completely different reasons. He treats his customers fairly because he thinks that cheating people is wrong, and he is committed to living up to the highest moral standards. This motivation earns the second shopkeeper the greatest praise. According to Kant, his actions and character display a worth that (like the value of humanity) is literally priceless. He is not for sale; he cannot be bought.

Kant's second point, about the importance of reason in motivating worthy conduct, is fairly complex. He thought that reason, operating alone and in the absence of any desires or emotions, could do double duty. It could reveal your moral duty, and it could motivate you to obey it.

To have a good will is, first of all, to know where your duty lies. Reason alone can tell you this. We can know what is morally required of us without the help of our feelings and emotions. When we determine whether a maxim is universalizable or think about whether a proposed action will respect the humanity in others, we don't need to want or feel anything at all. We just need to carefully follow the three-step test for a maxim's universalizability, or to reflect on the importance of autonomy. We can reason our way to moral knowledge. Indeed, for Kant, neither our wants nor our emotions play any essential role in moral discovery. We must be able to determine what is right and wrong by rational thinking alone, without the aid of desires or feelings.

That's because Kant saw these as unreliable moral guides. Compassion can lead you to wrongly help an escaping criminal; the courage of a terrorist can make his actions worse; anger can cloud impartial judgment. Our emotions often lead us astray, says Kant. They need to be guided by sound principles before we can trust them. Without such guidance, we might end up doing our duty, but that would be just a matter of luck.²

Further, and importantly, Kant thought that moral wisdom should be available to everyone, regardless of his or her emotional makeup. All of us are rational. We each have the power to reason well, even if we often fail to use this power as we should. But our emotions are not always under our control, and they will differ from person to person. If a specific emotional makeup is needed to gain moral wisdom, then such wisdom might be out of reach for many of us. Kant thought that such a view is elitist and a denial of the fundamental equality of all human beings.

Knowing what you are required to do is one thing; actually doing it is another. Here Kant also downgraded desires and emotions in favor of reason. He denied the claim, made famous by David Hume, that our motivations always depend on our desires. Hume thought that beliefs alone could never move us, and that we must want something before we will ever act. By contrast, Kant thought that we could do things even if we didn't want to do them, and even if we didn't think they'd get us anything we wanted. When acting from the good will, we are acting solely from an understanding of what is morally required of us, not from any desire or emotion. If our action is to have moral worth, then this understanding, all by itself, must be enough to motivate us.

Anticipating Freud by a hundred years, Kant argued that our motivations are hardly transparent. In fact, we can never be sure that we have ever acted from a good will. Still, even if we can't be sure that our actions have ever earned moral worth, we can know what standard we should aim for.

Kant went so far as to write that dutiful actions motivated by emotions or desires lack any moral worth. Those whose generous nature causes them to lend a helping hand are to receive no credit. Aid workers motivated by compassion or sympathy are not to be praised for their good deeds. But those who overcome a complete lack of interest and nonetheless offer help, not because they want to but just because it is their duty to do so, will receive full moral credit.

There are two ways to interpret Kant's message here. The first says that the presence of emotions is enough to rob an action of moral worth. The second is more charitable. It says that actions done solely from desire or emotion cannot possess moral worth, but that some cases of mixed motives—cases in which the good will moves us to act, though helped along by an emotional push—can yet have moral worth. Kant scholars are still conflicted as to which interpretation best captures his intentions.

². This thought is perfectly illustrated by a catty remark quoted in a biography of Napoleon's sister, Pauline. She was notoriously pampered and unfaithful, an irresponsible spendthrift with a full sense of entitlement. She was sometimes capable of bravery and generosity. But this was unpredictable, and for the most part she behaved very badly. Later in life, a former acquaintance gave the following account: "Although she was the most beautiful person one could imagine, she was also the most unreasonable. . . . [T]alking inconsequentially, laughing at nothing and at everything, she contradicted the most serious people and put out her tongue at her sister-in-law when Josephine wasn't looking. . . . [S]he had no principles and was likely to do the right thing only by caprice." (My italics.) As quoted in Flora Fraser, Pauline Bonaparte: Venus of Empire (New York: Alfred A. Knopf, 2009), p. 25.
Five Problems with the Principle of Humanity

Despite its many attractions, the principle of humanity, with its emphasis on rationality and autonomy, is not trouble-free. There are five especially serious worries about the principle:

1. The notion of treating someone as an end is vague, and so the principle is difficult to apply.
2. The principle fails to give us good advice about how to determine what people deserve.
3. The principle assumes that we are genuinely autonomous, but that assumption may be false.
4. The principle assumes that the morality of our actions depends only on what we can autonomously control, but the existence of moral luck calls this into question.
5. The principle cannot explain why those who lack rationality and autonomy are deserving of respect.

Let's consider each of these problems in turn.

Vagueness

Unlike the three-step process used to apply the principle of universalizability, there is no straightforward test that tells us how to apply the principle of humanity. It tells us to treat humanity as an end—in other words, with the respect that people deserve. It's sometimes crystal clear whether the principle is being honored. No one doubts, for instance, that the principle is violated by treating a plumber as a piece of pipe or by shooting a trespasser for trampling the lawn. But the vagueness of the notion of treating someone as an end often makes it difficult to know whether our actions are morally acceptable. Do we respect celebrities by telling the truth about their private lives—even when this is damaging to their reputations? Is it disrespectful to enemy soldiers to set land mines at our borders? Are we failing to give due respect to famine victims if we spend money on a new TV rather than giving money to an aid agency?

We can't know the answer to these questions without a better understanding of what it is to treat someone as an end. Without a more precise test of when we are respecting others and treating them as they deserve (i.e., as their rationality and autonomy demands), the principle of humanity fails to give us the guidance that we expect from an ultimate moral principle.

Determining Just Deserts

The second concern is about whether it is always appropriate to give people what they deserve. Kant certainly thought so. Recall his thinking, from the last chapter, about the prime importance of doing justice. Doing justice involves giving people their just deserts—even if this is not going to benefit anyone.

Sometimes this seems clearly right. A murderer ought to be punished, even if a governor's pardon will make more people happier. An employee ought to get paid for her work, even if her employer could do more good by giving her salary to charity. But there are also problems, as we'll see.

Kant has a partial reply to the problem of vagueness, mentioned just above. He offers us a test for what wrongdoers deserve. That isn't the whole story, of course, since we also want to know how to apply the principle of humanity in cases where blame and punishment are not an issue. But even in contexts of condemnation, Kant's test—the famous lex talionis, or eye-for-an-eye principle—is fraught with difficulties. And so we are left with problems. In some cases, we don't know how to apply the principle of humanity, because it is unclear what treating a person as an end really amounts to. In other cases, it is clear—but also pretty clearly mistaken.

Lex talionis (the law of retaliation) tells us to treat criminals as they have treated their victims. Kant claimed that such punishment treats a criminal as an end, and thus with the respect he deserves, because it treats him as a rational and autonomous person. Punishment is justified, for Kant, only if criminals are autonomous, and so able to freely choose their maxims. Those who are insane, for instance, are not fit for punishment. Punishment also presupposes that criminals are rational, in the sense of trying to act on principles that they can consistently intend everyone else to act on. A criminal's rationality permits us to turn his principles back on him, and do to him what he did to his victim. That is just what lex talionis requires.

Punishment that is administered as lex advises can be deeply satisfying. It can get criminals to see things from their victims' perspective, and so open their eyes to the true nature of the damage they have done. Further, punishment in line with lex seems perfectly just, since the criminal can't rightly complain of being mistreated. As Kant says, we would laugh at a criminal who protested against a punishment that harmed him exactly as he harmed his victim. Lastly, in the difficult matter of determining how to punish criminals, lex often gives us concrete, practical advice. What to do with a murderer, for instance? Kant counsels us to avoid the "serpent-
windings" of utilitarianism and banish all thoughts of whether the death penalty is going to reduce the murder rate. A murderer deserves to die—lex says so. Therefore, morality requires his execution.

These attractions account for lex’s broad appeal. Despite the widespread enthusiasm, however, lex talionis is fatally flawed. Three reasons explain its failure.

1. First, lex cannot explain why criminals who intentionally hurt their victims should be punished more than those who accidentally cause the same harm. Lex tells us to set the punishment by reference to the suffering of the victim. But victims can suffer the same harm, whether the perpetrator has carefully planned to cause it or has caused it by accident. If I am recklessly practicing archery in my backyard and unintentionally skewer my neighbor, I deserve less punishment than a cold-blooded murderer. Or so we think. Lex does not allow for that, since the victims in both cases have suffered the same harm.

We could say that what criminals deserve is determined not only by the harm they have done, but also by how blameworthy they are in bringing it about. So a hired killer should be punished more than a reckless archer, because the murderer displays a kind of moral corruption that the archer lacks. This does give us the right answer—the callous killer should be punished more. But it comes at the cost of abandoning lex.

That’s because we are no longer required to treat the criminal as he treated his victim. If an assassin deserves to be executed, then those who kill, but are less guilty than an assassin, should receive a lighter sentence than death. That undermines the letter and spirit of lex talionis, since these less-guilty killers will not be harmed just as they have harmed their victims. And it also removes one of the great virtues of lex talionis—that of offering precise guidance on how much criminals should be punished.

2. A second problem with lex is that it cannot tell us what many criminals deserve. This is most obvious in crimes that lack victims. Suppose an assassin attempts (but fails) to kill his victim, and the victim never discovers this. No harm, no foul? Suppose that someone leaves a bar well and truly drunk, and then manages to drive home without hurting anyone. Still, she deserves to be punished, but since there is no victim, lex offers no basis for punishment.

Other crimes may have victims, and yet lex offers no advice about their punishment. What to do with a hijacker or a counterfeiter? A kidnapper? Someone who transports stolen mattresses across state lines? The idea of treating these people just as they’ve treated their victims makes little sense.

3. Lastly, the guidance that lex provides, when it does prescribe a punishment, is sometimes deeply immoral. It’s a sad truth: any horror you can imagine people doing to one another has probably already been done. People have raped and tortured others, have burned whole families as they slept in their homes, have severed their limbs, tossed acid in their faces, and thrown handcuffed victims out of airplanes and helicopters. Does morality really require that we do these things to the criminals who committed such deeds? We don’t want official torturers, rapists, and arsonists on the state payroll. Legal punishment is the state’s business, and we insist that the state meet certain minimum moral standards. A state that rapes its rapists is failing, miserably.

These three problems show that lex cannot be the whole story about justice, because lex sometimes fails to give advice when it is needed, and sometimes gives bad advice. That means that when lex gets it right, it does so because its recommendations agree with those given by some more basic principle of justice. Homework: discover that basic principle.

In any event, most of us think that giving people the punishment they deserve sometimes has to take a backseat to other moral concerns. Our practice of allowing for parole, plea bargains, executive clemency, pardons, and suspended sentences attests to that. Each of these can be seen as an exercise in mercy—in treating people more kindly than they deserve. And mercy is a virtue. Kant’s position requires that we never indulge in merciful treatment of criminals.

Suppose that maintaining a system of punishment required so much money that we had to drastically sacrifice funds for schooling, for health programs, and for national defense. In that case, perhaps we should punish criminals a bit less than they deserve, so as to save resources to meet these other social needs.

Suppose that punishing criminals as they deserve were to increase the crime rate rather than reduce it. Most would think this an excellent reason to lighten punishments.

Justice is very important. But these considerations should make us wonder whether Kant was right to think that justice must always be done, no matter its costs.

Are We Autonomous?

A third concern about the principle of humanity is that it is based largely on a questionable assumption—namely, that we are autonomous. I do believe that I am autonomous. And so do you. We all do. But our confidence may be misplaced. The Argument against Autonomy explains why:
1. Either our choices are necessitated or they are not.
2. If they are necessitated, then they are out of our control, and so we lack autonomy.
3. If they are not necessitated, then they are random, and so we lack autonomy.
4. Therefore, we lack autonomy.

Suppose our choices are necessitated—suppose, in other words, that we are determined to choose as we do. But how could that be? After all, don’t you at this very moment have a choice about whether to put this book down or to continue reading? The choice is up to you. So long as your free choices are dictating your actions, you are autonomous.

But consider this: is anything influencing your choice? Of course. You choose to continue reading at least partly because you want to, because you believe you are able to, because you have no more appealing options, and because no one is forcing you to choose something else. Given all of these influences (and others, no doubt), it seems that you were bound to choose as you did.

True, it’s not as if you are fated to keep reading no matter what. Rather, the idea is that you are destined to keep reading given your circumstances and your mind-set (your beliefs, desires, aims, etc.).

But the causes of your choice (your beliefs, desires, etc.) are also caused. These further causes don’t spring up from nothing. You chose to keep reading partly because you wanted to. And you wanted to keep reading because (perhaps) you have been assigned this chapter and want to do well in the course you are taking. But your desire to do well in the course also has an explanation. It was caused by other desires and beliefs of yours, which, in turn, were caused by other factors, and so on, and so on. Ultimately, our choices can be traced to causes over which we lack control—causes such as our genetic inheritance, our parental upbringing, and a variety of social influences. If we choose as we do because of factors that ultimately are out of our control, then our choices are ultimately out of our control. And so, if our choices are necessitated to be what they are, then we are not autonomous. That is what premise 2 says.

Now assume that our choices are not necessitated. Suppose that nothing determined that you would choose to continue reading, for instance. You just chose to do so. If that were the case, wouldn’t that show that you chose freely?

No. If nothing causes us to choose as we do, then our choices seem completely random. Randomness undermines control, and hence undercuts autonomy.

Suppose I’m walking down the hall and see someone thrust out her arm and hit a bystander. Did she choose to hit him? Yes. Why? No reason. No cause. No explanation. It was just one of those things, completely out of the blue, unaccountable. But if that is really so—if nothing at all is causing her choice—then it seems that she isn’t in command of her choices. They are something that happen to her, a passing fit of some sort, rather than something we can credit or blame her for. Her choices are out of her control. And that is what premise 3 says.

Thus, either way we go—whether our choices are necessitated or not—it seems that we lack autonomy. If that is so, then the Kantian basis of our dignity, and the source of our duty to respect others, is undermined.

Of course many philosophers (and almost all nonphilosophers) think that something is wrong with this argument. Its logic is watertight, so if there is an error, it must be in one of the three premises. Premise 1 is pretty clearly true. So the problem, if there is one, must lie in premise 2 or 3. Philosophers who think that we really do have autonomy have split on which premise to attack. Their work has been fruitful. (It has certainly multiplied—the issues of freedom and determinism nowadays form an entire subfield within philosophy.) So perhaps the pessimistic conclusion of this argument is false. But only a great deal more philosophy could show it so.

Moral Luck

Perhaps there is a flaw in the Argument against Autonomy. I hope so. Let’s indulge this hope for now and assume that we are genuinely autonomous. Still, there are reasons to doubt that the morality of actions really depends on our autonomous choice.

Kant believes that we are rightly praised or blamed only for what we can control. That’s why autonomy is so important. Autonomy is control—over our choices, and over our actions. Yet factors outside of our control apparently affect the morality of our conduct. If that is true, then autonomy may not play the central role in morality that Kant thinks it does.

The results of our actions are not fully within our control. And therefore they are morally irrelevant, from Kant’s point of view. That is one of the main reasons that he so strongly opposes utilitarianism. And yet the results of our actions often do seem to make a moral difference.

Consider a good parent who, in a moment of extreme frustration, shakes her baby to jolt it out of a crying jag. Ordinarily, there is no lasting harm, the incident is forgotten, and we don’t change our view of the mother’s virtues. But babies sometimes die from such treatment. When they do, we
judge the killer much more harshly than we do other parents—most of whom have shaken their babies at least once or twice, but have luckily done so without any permanent damage.

I sometimes find myself effectively driving on autopilot. I’ve drifted over into the oncoming lane; I’ve failed to see a pedestrian at a crosswalk; I missed a passing car in my side mirror. In each case it was pure luck that my inattention didn’t cause a (possibly fatal) accident. Many people are not so lucky. When their negligence results in someone’s death, they are blamed far more than I have ever been. Yet they may be no worse a driver (or a person) than I am.

You probably know someone who is petty, vindictive, and unsympathetic to the needs of others. A strict rule follower, someone who likes to pander to authority. Calculating and smart. This is the sort of person who can make office life pure hell. In decent circumstances, that is the worst he can do. Yet if he finds himself a citizen of an authoritarian regime, such a man can take the reins of a torture unit or a concentration camp and manage it with ruthless efficiency. It is simply a matter of luck that he is living in a peaceful society, rather than Germany in the 1940s, South Africa in the 1980s, or North Korea today. In different circumstances, we might well have charged him with complicity in torture or murder.

These are all examples of moral luck—cases in which the morality of an action or a decision depends on factors outside of our control. If Kant is right, moral luck cannot exist. And he may be right. But if he is, then we have to revise our moral views in each of these cases, and many others. A drag race down country lanes is fondly remembered—unless it leads to a paralyzing accident. The risky investment is harshly condemned if it forces bankruptcy, but celebrated if it establishes a family fortune. A revolutionary is a hero if his side wins, a despised traitor if it doesn’t.

There is a tension at the heart of our moral thinking. We don’t blame babies for any harm they cause. Adults who have been hypnotized or those who have been slipped an LSD tab are also immune from blame. Kant explained this perfectly: such people lack autonomy. They aren’t in full control of their actions. But if Kant is right, and control is essential for moral responsibility, then we must abandon all of the moral judgments recorded in the previous paragraphs. It isn’t an easy choice to make.

The Scope of the Moral Community
The final concern has to do with membership in the moral community. Kant’s emphasis on rationality and autonomy forces us to draw the lines of this community very narrowly. We are in. Infants aren’t. The severely mentally ill and mentally retarded are out. So too are all nonhuman animals, and all plants and ecosystems. They all lack rationality and autonomy. By Kant’s lights, they therefore have no intrinsic moral importance. We owe them no moral concern, and so, it seems, we can treat them any way we want.

We can express this worry in the Argument against Animals:

1. If the principle of humanity is true, then animals have no rights.
2. If animals have no rights, then it is morally acceptable to torture them.
3. Therefore, if the principle of humanity is true, then it is morally acceptable to torture animals.
4. It isn’t.
5. Therefore, the principle of humanity is false.

Though this argument focuses on animals, we could easily amend it to apply to infants, the severely mentally retarded, and so on. Kant’s views exclude all of them from the moral community. But since Kant himself focused only on the case of animals, let’s follow his lead. We can discuss the other cases as needed.

Kant thought that it is wrong to torture or otherwise mistreat animals. So he accepts the fourth premise of the argument. He also accepts its first premise. He thought that rights require autonomy, that animals lack it, and that they therefore lack rights. As he saw it, the second premise is the one that has to go.

Kant offered two arguments for rejecting the second premise. Both of them fail.

He first claimed that harming animals will harden our hearts, and so make it likely that we will mistreat our fellow human beings. Since that really would be immoral, we must not harm animals.

Kant’s predictions about how we might be led to harm our fellow human beings are quite shaky. Most of us are easily able to make distinctions in our treatment of members of different groups. Abusive bosses usually treat their superiors with respect. Ruthless prison guards can be loving parents. Doctors who are condescending to their patients and nurses are often quite decent to their fellow doctors. So mistreating one group needn’t lead to mistreating others.

Further, if Kant is right, we humans really do possess infinitely greater moral importance than animals. Anyone who takes that message to heart...
would resist harming his fellow humans—even if he felt comfortable hurting animals.

Kant faces a problem even if his predictions are right. For the reasoning he is employing here is pure consequentialism. Don’t torture animals, because that will have terrible results (it will lead to the mistreatment of humans). But as we have seen, Kant bases his theory on the view that results are irrelevant to the morality of actions. So this reply will not do.

He has a second. I own a desk. It obviously isn’t rational or autonomous. And yet no matter how much someone wanted to take a hammer to it, it would be wrong to do so. Not because the vandal would be wronging the desk, but because he would be wronging me. The desk has no rights. But I do. And these must be honored. And so, even though my three cats, for instance, have no rights, it would be immoral to hurt them, since in doing so, my rights (as their owner) would be violated.

There are two basic difficulties with this view. First, it offers no moral protections to wild animals. And second, domesticated animals will have no moral protection against their owners. If I decided to destroy my desk, just for the fun of it, I’d be doing nothing wrong. And since the Kantian view sees animals as morally on a par with my possessions, it can’t explain why it would be wrong of me to destroy my animals simply because I wanted to.

That isn’t the only bad news. Remember, this problem applies not only to animals but also to all human beings who lack rationality and autonomy. True, most of them (infants, the senile, the temporarily comatose, etc.) are loved by others. And so Kant might be able to claim that our rights (i.e., the rights of those who love such human beings) would be violated if anyone were to harm them. But what of the most piteous of humanity—the unloved, abandoned human beings who lack autonomy? Kant’s theory gives them the same status as an unowned desk or animal. They are disposable and may be treated as we like. Kant thus excludes the most vulnerable among us from membership in the moral community.

Conclusion

Kant’s ethical views are rich and suggestive. They are extremely important in their own right, but it can also be quite helpful to contrast them with the consequentialist outlook that is so popular in political and economic circles these days. As we have seen, Kant’s opposition to consequentialism was deep and thorough. These are the main points of disagreement:

1. Kant denied that benevolence is the central moral virtue, and thought instead that justice and integrity occupied that role.
2. Kant regarded many of the basic moral rules as absolute, and so insisted that it was never acceptable to break them—even if breaking them led to better results.
3. Kant denied that the morality of actions could depend on results or other factors outside of one’s control, and claimed instead that they depend solely on what we can be held responsible for—our maxims and our free actions.
4. In a related point, Kant rejected the exclusive emphasis on the future and an action’s results in determining what is right and wrong, and instead made past actions, and their just deserts, a central basis for moral evaluation.
5. According to utilitarians, all it takes to be a member of the moral community is a minimal level of well-being; Kant thought instead that autonomy and rationality determined moral status.
6. Kant denied that happiness or well-being is always valuable in its own right, and instead believed that the good will—the steady commitment to do one’s duty for its own sake—is the only thing that is valuable in all situations.

Many of the shortcomings of consequentialism are nicely handled by the Kantian theory. But consequentialists are pleased to return the favor: the Kantian theory isn’t without its own problems, and many of those are neatly addressed by consequentialism. Let’s now have a look at another important contender, the social contract theory, whose defenders hope to secure many of the benefits of these two ethical outlooks, while escaping the problems that confront them.

Discussion Questions

1. What is the relationship between Kant’s principle of universalizability and the principle of humanity? Do the two ever give conflicting advice? If so, which do you think is a better guide to our moral obligations?
2. According to Kant, what is the source of human rights? What does his account imply about the rights of animals and disabled humans? Do you find his views on this subject plausible?
3. What does Kant mean by "the good will"? How is it possible for someone to do the right thing, but still lack a good will? Do you agree that actions are praiseworthy only if they are performed from the good will?

4. Kant endorsed the principle of lex talionis, which states that we should treat criminals as they treated their victims. What do you think is the strongest objection to such a view? Can this objection be overcome?

5. What is autonomy? Do you think people have it? Why or why not?

The Social Contract Tradition

The Theory and Its Attractions

The Lure of Proceduralism

One of the hardest and deepest problems for ethical inquiry is this: how to begin?

Should we assume, from the outset, that any plausible ethical theory will forbid rape and slavery and torture, and require compassion and kindness? If so, then we can use these assumptions as a litmus test. Any theory that contradicts these assumptions would be rejected. For instance, if killing or torturing an innocent person were ever in your self-interest, then ethical egoism would require you to perform such actions. It would therefore flunk our test. That would be enough to show that ethical egoism is false.

A question naturally arises: can we justify our basic assumptions and defend the practice of rejecting any moral theory that doesn't agree with them? If a theory contradicts our basic assumptions about right and wrong, why does that undermine the theory, rather than our assumptions? Aren't we just begging the question against the ethical egoist, for instance, by assuming that self-interest could never justify torture or rape?

Defenders of this approach claim that there is no other alternative. We have to start moral thinking from somewhere—why not with those basic assumptions that almost everyone accepts, those that help support most of our other ethical claims? We can't prove that these assumptions are true. But that doesn't make them illegitimate.

Why not? Because the fundamental starting points in every area of thinking are beyond proof. It turns out, for instance, that the basic assumption behind all scientific inquiry—that there is a physical world outside of
our own mind—cannot be proven. All the evidence we might collect in order to prove it already assumes that such a world exists. Yet that doesn't render every scientific claim implausible or unjustified.

Many philosophers remain dissatisfied with this approach. They believe that we can justify our basic moral views, rather than simply take them for granted. We can do that by coming up with a procedure that will tell us the steps for distinguishing right from wrong. The correct moral views are those that emerge from the correct procedure. I call this sort of approach proceduralism.

Proceduralism tells us that we should not begin moral inquiry by assuming, say, that slavery is wrong or that generosity is right. Make no moral assumptions at this stage. Instead, follow the correct procedure, and then see what the outcome is. Provided you've been careful, you'll land on the right answer to your moral question.

Of course, there is the matter of how to identify the correct procedure. Here's one way to do it: the correct procedure is the one that supports our deepest moral beliefs, and receives support in turn from these beliefs. But proceduralists are certainly going to reject that answer. They want to show us how to arrive at moral wisdom without first assuming the truth of our basic moral beliefs or principles. This is a very difficult challenge, as we'll see.

The golden rule is an instance of proceduralism. So is rule consequent­ialism. So is Kant's principle of universalizability. Each of these views tells us to follow certain steps in order to discover what is right and wrong. One of the main attractions of these views is that they do not take it for granted that slavery, for instance, is immoral; rather, they promise to explain and justify why slavery is immoral. They do this by showing, respectively, that (1) we wouldn't like it if we were enslaved, (2) no optimific social rule would permit slavery, or (3) no universalizable maxim would allow slavery.

If you have been reading these chapters in order, you know that there are significant problems with each of these proceduralist views. But that doesn't knock proceduralism out of contention, since there are many other proceduralist theories. Perhaps the most important of these is the social contract theory, nowadays known as contractarianism: the view that morality is based on a social contract.

The Background of the Social Contract Theory

Contractarianism originated as a political theory, and only later developed into a theory of morality. It tells us that laws are just if, and only if, they reflect the terms of a social contract that free, equal, and rational people would accept as the basis of a cooperative life together. Its view of morality stems directly from that political ideal: actions are morally right just because they are permitted by rules that free, equal, and rational people would agree to live by, on the condition that others obey these rules as well.

The theory's political origins can be traced back to the ancient Greeks. Early in the Republic, Plato's brothers tell Socrates that they find the social contract view both appealing and troubling. They challenge Socrates to tell them what is wrong with it. His answer takes up almost the whole of the book, a testament to the power of contractarianism.

Here is the story that Socrates heard. We are all by nature largely, or entirely, self-interested. What we want is power over others, physical security, plenty of money, and sensual pleasure. Our deepest goal is to lord it over everyone else. Who among us wouldn't want the power of the president or the wealth of Bill Gates—or, ideally, both?

This points to an obvious problem. Everyone wants to be at the top of the heap, and only a few can make it there. Further, no one wants to be a patsy, the person who gets stepped on as others climb the ladder of success. We each want to be number one. But we know that the chances of making it are slim, and we want to avoid being trampled as others claw their way to the top. So what do we do?

If we are rational, we will each agree to curb our self-interest and cooperate with one another. We'll do this conditionally—that is, on the condition that others do so as well. A complete free-for-all is going to make everyone miserable. If we all stop trying to get the better of each other, and instead agree to seek a little less for ourselves, then we'll all be better off.

That is what reason and morality require of us, according to the social contract theory. Starting with the assumptions that we each are largely motivated by self-interest, and that it is rational to be that way, contractarianism tells us that we each do best for ourselves by agreeing to limit the direct pursuit of self-interest, and accept a bargain that gets us a pretty decent life. That everyone gets such a life means that we give up the chance of an absolutely fabulous life. But we also protect ourselves from a really terrible one, a life in which we are in the thick of a cutthroat competition, vulnerable to the attacks of everyone around us. That is a deal worth making. Here's why.
The Prisoner's Dilemma

Consider life's basic scenario: There is intense competition for scarce resources. We each want as much of those resources as we can get. Being rational, we each try to get as much as we can, knowing that more for us means less for someone else. Things are going to get very bad, very quickly.

This is what happened to the thousands of fishermen who sought ever larger catches, resulting in the emptying of the Chesapeake Bay—for centuries one of the world's greatest fisheries. This is what happened when baseball players, Tour de France cyclists, and Olympic weight lifters began to take increasingly dangerous anabolic steroids, in a bid to gain a competitive edge and lucrative championships. This is what happens when a politician starts a smear campaign and his opponent feels the need to ramp up the abuse in order to stand a fighting chance in the race. This is what always happens in turf battles over the spoils of an illegal drug trade.

These cases all share the same essential features. In each, there is mounting competition over a scarce resource, and many are trying their best to increase their share of it. That seems to be rational, and yet, if everyone stopped being so selfish, each person would be better off. There would still be fish in the Chesapeake, sustaining the communities surrounding it. Athletes would be safer, even if the world records in their fields were a bit less spectacular.

These sorts of situations, in which everyone would be better off by scaling back their pursuit of self-interest, are known as prisoner's dilemmas. The name comes from a scenario, introduced by economists, in which two thieves (call them Al and Bob) are caught and sent to separate detention cells. Being rational, Al and Bob previously made a deal with each other: if they get caught, they'll each keep silent, to thwart the police and protect themselves. Now that they have been captured, the police tell each one the same thing:

*If you keep your promise to your partner by keeping quiet, and he rats you out, then he's off the hook, and you're looking at a six-year sentence. If you break your word and snitch on him, while he remains silent, you're home free, while he spends the next six years in jail. If you both keep quiet, you'll each get two years. But if you both confess, you'll each get four.*

The following diagram will help you keep track of the options. Each number represents years in jail. The first number in each pair is Al's prison sentence; the second is Bob's.

Suppose that both criminals know about the various outcomes, and that both have only one concern at this point: to minimize their jail time. If they are both rational, what are they going to do?

You might think that it's impossible to know the answer, since you don't know enough about Al or Bob, their bond with each other, their trustworthiness, and so on, to make an informed guess. But really, there is no doubt that each is going to confess. They are going to break their promise to each other, landing themselves a four-year sentence apiece. That's a far cry from getting off scot-free, and double the two years they'd get if they each kept quiet.

The important point is that remaining silent is the cooperative strategy. Silence here means keeping one's word, honoring the terms of the deal. Confession is a betrayal, breaking one's promise, abandoning a partner. Al and Bob are going to betray each other. That's certain. They'll do this because they know the odds, because they are self-interested, and because they are rational.

Why will they confess? Because no matter what his accomplice does, each criminal will be better off by confessing.

Consider Al's choices. Suppose that

**Bob remains silent.** Then if Al confesses, Al is home free. If Al keeps his mouth shut, Al gets two years. So if Bob remains silent, Al should confess. That will minimize his jail time. That is what he most wants. So, if Al is rational, he will confess.

Now suppose that

**Bob confesses.** Then if Al confesses, Al gets four years in jail. Silence gets him six. So if Bob confesses, Al should confess, too.

Thus, either way, Al does best for himself by spilling the beans and breaking his promise to Bob. And of course Bob is reasoning in the same way. So they are both going to confess and end up with four years in jail.
The prisoner’s dilemma isn’t just some interesting thought experiment. It’s real life. There are countless cases in which the rational pursuit of self-interest will lead people to refuse to cooperate with one another, even though this leaves everyone much worse off.

The Chesapeake fishermen were in a prisoner’s dilemma with one another. So are world-class athletes, once they discover that some of their competitors are taking performance-enhancing drugs. So are gang members who are gunning for their competition. A cooperative strategy would have saved them their livelihoods or their lives.

Cooperation and the State of Nature

So why don’t competitors cooperate? The answer is simple: because it is so risky. The criminals in the prisoner’s dilemma could cooperate. But that would mean taking a chance at a six-year sentence and betting everything on your partner’s good faith. Unilaterally keeping silent, reducing your catch, refusing the use of steroids, forsaking violence—these are strategies for suckers. Those who adopt them may be virtuous, but they are the ones who will be left behind, rotting in jail, economically struggling, off the Olympic podium, or the victim of an enemy’s gunshot. If enough people are willing to do what it takes to ensure that they get ahead, then you’ve either got to join in the competition or be the sacrificial lamb.

Englishman Thomas Hobbes (1588–1679), the founder of modern contractarianism, was especially concerned with one sort of prisoner’s dilemma. He invited the readers of his magnum opus, Leviathan, to imagine a situation in which there was no government, no central authority, no group with the exclusive power to enforce its will on others. He called this situation the state of nature. And he thought it was the worst place you could ever be.

In his terms, the state of nature is a “war of all against all, in which the life of man is solitary, poor, nasty, brutish and short.” People ruthlessly compete with one another for whatever goods are available. Cooperation is a sham, and trust is nonexistent. Hobbes himself lived through a state of nature—the English Civil War—and thus had firsthand knowledge of its miseries. If you’ve ever read The Lord of the Flies, you have an idea of what Hobbes is talking about. As I write this, I can turn on my television and see pictures of states of nature from around the world—in parts of Somalia, Sudan, Afghanistan. The scenes are terrible.

The Hobbesian state of nature is a prisoner’s dilemma. By seeking to maximize self-interest, everyone is going to be worse off. In such dire circumstances, everyone is competing to gain as much as he can, at the expense of others. With so much at stake, an all-out competition is bound to be terrible for almost everyone. No one is so smart or strong or well-connected as to be free from danger. No one is safe. There is no security and no peace.

There is an escape from the state of nature, and the exit strategy is the same for all prisoner’s dilemmas. We need two things: beneficial rules that require cooperation and punish betrayal, and an enforcer who ensures that these rules are obeyed.

The rules are the terms of the social contract. They require us to give up the freedom to attack and to kill others, to cheat them and lie to them, to beat and threaten them and take from them whatever we can. In exchange for giving up these freedoms (and others), we gain the many advantages of cooperation. It is rational to give up some of your freedom, provided that you stand a good chance of getting something even better in return. The peace and stability of a well-ordered society is worth it. That is the promise of the social contract.

But you need more than good rules of cooperation to escape from a prisoner’s dilemma. You also need a way to make sure the rules are kept.

The state of nature comes to an end when people agree with one another to give up their unlimited freedoms and to cooperate on terms that are beneficial to all. The problem with agreements, though, is that they can be broken. And without a strong incentive to keep their promises, people in prisoner’s dilemmas are going to break them. Just think of Al and Bob in our original example.

What’s needed is a powerful person (or group) whose threats give everyone excellent reason to keep their word. The central power doesn’t have to be a government—it could be a mob boss, who threatens Al and Bob with death if they were to break their silence. It could be the International Olympic Committee, with the power to suspend or disqualify athletes who test positive for illegal substances. But in the most general case, in which we are faced with anarchy and are trying to escape from utter lawlessness, what we need is a government to enforce basic rules of cooperation. Without a central government, the situation will spiral downhill into a battleground of competing factions and individuals, warlords and gang bosses, each vying for as much power and wealth as possible. A war of all against all isn’t far behind.

Social contract theorists justify political authority—the power of a government to force its citizens to do things—by claiming that rational,
free, and equal people would agree to being governed. This agreement is easily explained. Who wouldn't prefer to live in a stable, peaceful society than in a lawless anarchy? Certainly, no government is perfect, and governments, like private citizens, can abuse their powers. Still, leaders earn the consent of the governed by making life better off than it would be in the state of nature. When they succeed in this, rational people will give them their allegiance.

The Advantages of Contractarianism

Contractarianism has many advantages. Here are some of the most important ones.

Morality Is Essentially a Social Phenomenon

For anyone all alone on a desert island or on a remote mountain retreat, there is no possibility of moral or immoral action. That is because moral rules are nothing other than special rules of cooperation, and when it comes to cooperation, it takes at least two to tango.

This explains why we have no self-regarding moral duties (duties that apply only to oneself). True, we can fail ourselves in a number of ways. We can become strung-out addicts and ruin our potential. We can make poor financial decisions that leave us bankrupt. We can make an awful career choice and spend our days in drudgery. In all of these cases we are highly imprudent. But when such actions have no bearing on others (they often do, of course), then contractarians will deny that there is anything immoral about them.

Contractarianism Explains and Justifies the Content of the Basic Moral Rules

On the contractarian account, the moral rules are ones that are meant to govern social cooperation. When trying to figure out which standards are genuinely moral ones, contractarians ask us to imagine a group of free, equal, and rational people who are seeking terms of cooperation that each could reasonably accept. The rules they select to govern their lives together are the moral rules. These will closely match the central moral rules we have long taken for granted.

John Rawls (1921–2002), the most famous twentieth-century social contract theorist, had a specific test for determining the rules that the ideal social contractors would support. In his *Theory of Justice* (1971), by most accounts the most important work of political philosophy written in the last century, Rawls has us envision contractors behind a *veil of ignorance*. This is an imaginary device that erases all knowledge of your distinctive traits. Those behind the veil know that they have certain basic human needs and wants, but they know nothing of their religious identity, their ethnicity, their social or economic status, their sex, or their moral character. The idea is to put everyone on equal footing, so that the choices they make are completely fair.

When placed behind a veil of ignorance, or in some other condition of equality and freedom, what social rules will rational people select? These will almost certainly include prohibitions of killing, rape, battery, theft, and fraud, and rules that require keeping one's word, returning what one owes, and being respectful of others. Contractarianism thus easily accounts for why the central moral rules are what they are—rational, self-interested people, free of coercion, would agree to obey them, so long as others are willing to obey them, too.

The rules of cooperation must be designed to benefit everyone, not just a few. Otherwise, only a few would rationally endorse them, while the rest would rationally ignore them. This allows the contractarian to explain why slavery and racial and sexual discrimination are so deeply immoral. Biased policies undermine the primary point of morality—to create fair terms of cooperation that could earn the backing of everyone. Even if oppressed people identify with the interests of their oppressors, and staunchly defend the system of discrimination, that does not make it right. The correct moral rules are those that free people would endorse for their *mutual* benefit—not for the benefit of one group over another.

Contractarianism Offers a Method for Justifying Every Moral Rule

Contractarianism is a prime example of proceduralism. Contractarians have a method for seeing whether certain actions are right or wrong. They invite us to think about whether free, equal, and rational people would agree to live by rules that allow the action in question. Contractarians do not assume that the standard moral evils are bad; rather, they *show why* they are bad, by showing that rational contractors, getting together to select mutually beneficial rules of cooperation, would forbid such behavior.

Thus, we are never at the point where we have to say to people, "Don't you just see that (fill in the blank) is wrong?" Contractarians never have to make this move, which is excellent, since it can't possibly
convince someone who doesn't already agree with you. Rather, contractarianism offers a method for justifying every single moral rule. Of course disagreements will arise when we apply this method. There is plenty of room for argument about what free, equal, and rational people would accept. Still, if contractarianism is correct, then we will always have something to say when it comes to justifying even the most fundamental moral claims.

**Contractarianism Explains the Objectivity of Morality**

Contractarianism offers an attractive picture of the status of morality. Moral rules, on this view, are objective. Anyone can be mistaken about what morality requires. Personal opinion isn't the final authority in ethics. Neither is the law or conventional wisdom—whole societies can be mistaken about what is right and wrong, because they may be mistaken about what free, equal and rational people would include in their ideal social code.

Thus contractarians have an answer to a perennial challenge: if morality isn't a human creation, where did it come from? If contractarianism is correct, morality does not come from God. Nor does it come from human opinion. Rather, morality is the set of rules that would be agreed to by people who are very like us, only more rational and wholly free, and who are selecting terms of cooperation that will benefit each and every one of them.

Thus contractarians don't have to picture moral rules as eternally true. And they can deny that moral rules are just like the rules of logic, or of natural science—other areas where we acknowledge the existence of objective truths. The moral rules are the outcomes of rational choice, tailored to the specifics of human nature and the typical situations that humans find themselves in. This removes the mystery of objective morality. Even if God doesn't exist, there can still be objective values, so long as there are mutually beneficial rules that people would agree to if they were positioned as equals, fully rational and free.

**Contractarianism Explains Why It Is Sometimes Acceptable to Break the Moral Rules**

Moral rules are designed for cooperative living. But when cooperation collapses, the entire point of morality disappears. When things become so bad that the state of nature approaches, or has been reached, then the ordinary moral rules lose their force.

One way to put this idea is to say that every moral rule has a built-in escape clause: do not kill, cheat, intimidate, and so on, so long as others are obeying this rule as well. When those around you are saying one thing and doing another, and cannot be counted on to limit the pursuit of their self-interest, then you are freed of your ordinary moral obligations to them.

The basis of morality is cooperation. And that requires trust. When that trust is gone, you are effectively in a state of nature. The moral rules don't apply there, because the basic requirement of moral life—that each person be willing to cooperate on fair terms that benefit everyone—is not met.

This explains why you aren't bound to keep promises made at gunpoint, or to be the only taxpayer in a land of tax cheats. It explains why you don't have to wait patiently in line when many others are cutting in, or to obey a curfew or a handgun law if everyone else is violating it. When you can't rely on others, there is no point in making the sacrifices that cooperative living requires. There is no moral duty to play the sucker.

**More Advantages: Morality and the Law**

**Contractarianism Justifies a Basic Moral Duty to Obey the Law**

The social contract theory also has plausible things to say about why we are sometimes morally allowed to break the law. Before explaining this, though, consider why such cases are the exceptions, why we are usually, on contractarian grounds, morally required to obey the law.

The law enables us to escape from the state of nature, and so to gain all of the good things that come from a stable, peaceful society. And the benefits are real. We can securely purchase items online, safely walk the streets, trust the mail service, and rely on legal contracts that we've entered, only because most people involved in these activities honor the rules that benefit everyone.

You have a role to play here. Your obedience to the law helps to support the institutions that make so many benefits possible. Those who break the law are undermining these highly beneficial institutions. They are also taking unfair advantage of the sacrifices made by their fellow citizens. That is immoral. Therefore, we all have a basic moral duty to obey the law.

**The Contractarian Justification of Legal Punishment**

Those who break the law are rightly punished. And the social contract theory has a natural explanation of this. Its account nicely blends some of the most attractive aspects of consequentialism and Kantianism, while solving a couple of hard problems in the philosophy of law along the way.

If punishment fails to deter crime, then the state cannot effectively serve its enforcer role, and so its ultimate justification is undercut. To
achieve its aim of keeping the peace, the state's threats for lawbreaking have to be credible. To be credible, they must usually be carried out. And so, when people break the law, they need to be punished. That is the only way we can avoid falling into a state of nature.

Social contract theorists can also offer a Kantian rationale for legal punishment. When laws are good, they set out terms of fair play. When criminals break these rules, they take unfair advantage of their fellow citizens. They get all of the benefits of membership without shouldering the burdens that make the benefits possible. We right such wrongs by removing the criminal's ill-gotten gains. Punishment can do that. It can restore a level playing field. It can eliminate a criminal’s unjust enrichment. It corrects the balance of benefits and burdens in society, and thereby sends a message that everyone is equal before the law.

Criminals have acted as if they could simply take what they wanted, without making the needed sacrifices that the rest of us have made. In doing so, criminals have placed themselves outside the protection of the law. They cannot complain if they are punished as a result.

**Contractarianism Justifies the State's Role in Criminal Law**

The contractarian justification of punishment neatly answers two related questions that have long perplexed philosophers: (1) why should the state, as opposed to private citizens, be the one who brings criminal charges and administers punishments? and (2) why should we have a criminal law in the first place? Why not just have the civil law (torts, contracts, etc.), and allow those who have been wronged to bring lawsuits against those who have harmed them?

The social contract theory has answers. The state’s ultimate purpose is to aid our escape from the state of nature. This gives it special authority to determine who is posing a threat to social stability. The actions that are most dangerous to society—treason, assassination, hijacking, attacking government agencies—are prohibited by the criminal law. That makes perfect sense, given the different purposes of the criminal and civil law. The function of the civil law is to repair personal harms and wrongs; the function of the criminal law is to preserve the state, and all of the advantages it provides. That is why a state representative (say, a district attorney or federal prosecutor), rather than a private citizen, initiates criminal charges. And that is why criminal punishment is a state affair, rather than a private matter to be settled between citizens.

**Contractarianism and Civil Disobedience**

Contractarianism has attractive things to say about why we have a duty to obey the law, and why criminals are rightly punished for violating just laws. But what if the laws are unjust, and fail to set out fair terms of cooperation? What if the ideal social code and a society's actual laws are miles apart? In that case, the social contract theorist can explain why breaking the law (under certain circumstances) can be morally acceptable.

Laws are morally justified when they mirror the rules that free and equal people would accept. And so, when laws themselves are grossly unfair, or when fair laws are applied in a discriminatory way, the primary point of having a society under law is undermined. Those who always get the short end of the stick are being constantly asked to sacrifice themselves for the sake of others. That isn't right, and the social contract theory explains why. The point of morality is to guarantee mutual benefit from fair terms of cooperation. Discriminatory policies and practices only frustrate this goal.

Governments must earn the allegiance of their citizens. They do this by making their citizens much better off than they would be in a state of nature. That is why it is rational for people to agree to be governed. But when whole classes of people are enslaved or discriminated against, then the government has lost its moral authority over them. And that seriously weakens the moral duty to obey the government's laws.

Indeed, this means that it is sometimes appropriate to disobey the laws. The precise conditions are very difficult to state. But certain cases seem clear. Think, for instance, of the protests that Gandhi initiated against British colonial rule, those of Chinese democrats at Tiananmen Square, or those led by Martin Luther King, Jr., against segregationist laws in the American South. These cases of civil disobedience each involved illegal activities. But the laws being challenged were deeply immoral. And the illegal actions were morally powerful precisely because (1) the protestors took the law into their own hands only as a last resort, after all feasible negotiations had failed; (2) they acted openly, not secretly, and were willing to pay the price by going to jail and suffering the beatings of police; (3) they acted nonviolently, often in the face of physical violence; and (4) they were clearly motivated not by the promise of personal gain, but rather by the hope of furthering the cause of justice. In just about every respect, these classic cases of civil disobedience are morally very different from the work of ordinary criminals.

In acting as they did, the nonviolent protesters were showing a respect for the rule of law. This sounds paradoxical, but their message was clear. They tried to change the law because it was deeply unfair. They didn't want
to replace it with anarchy, but rather with a system of real legal justice. They recognized the great value of a society under law—under just law. When there is no choice but to remain oppressed, resort to violence, or opt for peaceful and open resistance to injustice, the social contract theory favors the latter course. Isn’t that the most admirable choice?

Discussion Questions

1. What is proceduralism, and how does it differ from other approaches to ethics? Why is contractarianism a form of proceduralism?
2. What makes a situation a “prisoner’s dilemma”? What is the rational thing to do in a prisoner’s dilemma situation?
3. What is the state of nature, and why does Hobbes think that such a condition would be so bad? How does Hobbes think that people would be able to emerge from the state of nature?
4. How do contractarians justify moral rules against such things as slavery and torture? Do you find their justifications of such rules to be compelling?
5. Do we have a duty to obey the law? If so, is this duty absolute, or can there be exceptions? How would a contractarian explain the existence of a duty to obey the law?

CHAPTER 14

The Social Contract Tradition

Problems and Prospects

Why Be Moral?

Most moral theories have tried to show how, on their terms, it is rational to be moral, and irrational to be immoral. Social contract theorists are no exception.

The classic statement of this contractarian aim is given in Hobbes’s Leviathan. Hobbes discusses the views of the calculating amoralist, whom he terms the Fool. The Fool admits that breaking his promises is unjust, but he doesn’t care about whether his actions are just or not. He cares only about his own self-interest. When keeping his promises will do him good, he’ll keep his promises. When it won’t, he won’t. He reasons that he’ll sometimes do best for himself by being unjust. When that is so, it is rational to act immorally.

Hobbes faces the challenge directly. He agrees with the Fool’s basic assumption: that self-interest is the fundamental reason for acting. On this line of thinking, you are rational to the extent that you increase your chances of becoming better off. Thus Hobbes has to show that acting morally is always likely to promote self-interest. That’s not so easy.

The specific case Hobbes considers is one in which the Fool has made a deal with someone else, and the other person has already done what he’s promised to do. Should the Fool keep his side of the bargain anyway?

Many will say no. Their advice is simple: take the money and run. That’s certainly immoral. But people can get away with their immorality. It has happened many times. In such cases, people get what they want without having to give up anything in return. It’s a black eye for justice. But it seems the height of rationality.
Hobbes disagrees. He allows that people sometimes get away with injustice. But that doesn’t make it rational to act unjustly. Consider the fabled gang that couldn’t shoot straight. They are a bunch of bumbler who do everything wrong, and yet through a series of lucky breaks, somehow manage to get away with their crime. They got what they wanted. But that doesn’t mean that they acted rationally. Hobbes says that injustice is always like this. Even if the perpetrators sometimes get the goods, thinking that they can do it without getting caught and paying the price is always a bad bet.

Thus the question isn’t whether immorality ever pays. Hobbes admits that it does. The question is whether acting unjustly ever increases the likelihood of personal gain. And Hobbes says that it doesn’t. Though people can sometimes get away with injustice, the chances of doing so are never good. So injustice is never rational.

One way to defend Hobbes’s conclusion is to raise the possibility of divine wrath. If you are immoral, then God is going to punish you, and no matter the worldly riches you’re after, they simply aren’t worth that misery. But Hobbes tosses this aside—the Fool he is considering is the same Fool who has said in his heart that there is no God. So the threat of divine punishment isn’t going to work.

He imagines his Fool telling people of his plans to defraud them. That would indeed be stupid. But of course a clever criminal isn’t going to do that. He’ll keep his plans to himself, and try his best to hide his tracks so that his injustice is never discovered, or is pinned on an innocent person.

We can make the challenge hardest for Hobbes by considering a classic puzzle of rationality: the free-rider problem. This occurs when lots of folks are cooperating in a way that brings some common good. So long as enough people are chipping in, this benefit can be enjoyed by all—even those who refuse to help out. These are the free riders. They are getting a benefit without sacrifices themselves. This refusal to contribute to the support of the common good seems highly unfair. But it also seems highly rational.

Let’s make this more concrete. Consider some shared public goods: keeping a park clean; maintaining a high level of decency in society; having democratic elections; eliminating a dreadful disease; having a secure national defense; having government agencies ensure the safety of our food, medicines, and highways. These are genuine goods, and yet they can be achieved only if most people in a society are contributing to them. Such contributions involve sacrifice, sometimes small (making time to vote, not tossing a wrapper to the ground), and sometimes potentially large (serving in the military, paying your tax bill).

In many of these cases, the contribution that any single individual makes is negligible. Democracy isn’t going to crumble if I decide not to vote. The park won’t be totally spoiled if I drop my gum wrapper on the grass. The government agencies will continue to do their work with or without my tax payment. Since that’s so, I might reason as follows: the particular resource doesn’t depend on my contribution; it will still be there whether I contribute or not. So, why make the sacrifice? I can gain the benefit of free elections or a secure national defense without taking the time to vote or serve in the military. I am not doing my fair share to support the common good. But I am getting something for nothing. How could that be irrational?

Of course, if you already care about not exploiting your fellow citizens, then it will be rational for you to make the needed sacrifices to help support these common goods. You won’t see voting, getting immunized, or paying taxes as a nasty burden, but rather as your contribution to causes that you wholeheartedly support. But suppose you don’t feel this way, or you do, but are starting to wonder whether you are being a dupe. Hobbes doesn’t assume that we are generous and public-minded. He is trying to show the person who is entirely self-interested why it would be a good bet, even for him, to do his fair share. Can he do it?

There are two things we might say on Hobbes’s behalf. First, we might argue, as he himself did, that the risks of doing wrong always outweigh its potential benefits. But this is simply mistaken. There are cases in which the chances of being found out are low, or the punishments are pretty mild and the benefits of injustice are really substantial. Since rationality, for Hobbes, is all about how much gain you can reasonably expect from an action, injustice can sometimes be highly rational.

What Hobbes could say is that it is never rational to behave unjustly in a well-ordered society. For him, such a society is one that offers reliable threats against breaking mutually beneficial rules. It won’t be rational to cheat on your taxes, for instance, if the penalties for doing so are very severe and you are sure to get caught.¹

¹ It is interesting that on Hobbes’s line of thinking, many criminal organizations will count as well-ordered societies. Think, for instance, of how badly police informants fare in the Mafia society or drug culture depicted in The Sopranos or The Wire. Going over to the feds or the cops is almost always a very bad bet, and that’s because the punishments for doing so are as bad as they can be, and pretty reliably enforced.
However, in our imperfect world, where enforcement isn’t foolproof, where punishments are sometimes pretty light, it can indeed be rational to take a chance at injustice. So long as we understand rationality as Hobbes does—as maximizing the chances of doing well for yourself—then he cannot show that injustice is always irrational.

But Hobbes might be able to show something nearly as comforting. Compare two claims:

1. No matter who you are, or what circumstances you find yourself in, it is always rational to act justly.
2. It is always rational to be a just person—the sort of person who values fairness, approves of just policies, tries to live an upright life, and becomes upset when learning of injustice.

Hobbes cannot defend claim 1. But he might be able to defend claim 2. And if he can, then he may also be able to show the following:

3. For just people, it is always rational to act justly.

And that would be a lot, even if it is a bit disappointing in leaving us without a surefire reply to the vicious person bent on doing evil.

Here is the best shot for Hobbes at defending claim 2. In the long run, just people are more likely to do better for themselves than unjust people. The upright person sleeps well at night. She has true friends. She has people she can share her delights with, be consoled by, confide her hopes and fears to. She isn’t always looking over her shoulder, wondering whether the police are after her. She can review her life with satisfaction, knowing that she has earned the trust of others. The life of virtue has a lot going for it.

Compare such a life with that of an immoral criminal, one who is always worrying whether a vengeful victim or a turncoat conspirator is hard on his heels. It is a life of great insecurity. Those always on the lookout for the main chance, for the opportunity to cheat someone or exploit the system, are playing a losing game. They might win a few hands along the way, but there’s not much in it as a long-term strategy. It isn’t rational to be the cheating type.

If this is right, then it is rational to be a virtuous person. And that is what claim 2 says. Further, if it is rational to be such a person, it is rational to try to stay that way. The best strategy for maintaining your good character is to keep on doing good things. For once we begin to give in to temptation, immorality can slowly chip away at virtue. It can be very hard to put on the brakes and prevent a slide into real corruption. Thus, for good people, it is rational to continue to act justly and to resist the call to stray from the path of virtue. That is precisely what claim 3 says.

That is the best case to be made for claims 2 and 3. And yet it also fails—or, rather, it isn’t a complete success. It may be rational to be a moral person in societies that are well ordered, stable, and largely just. But when corruption is rampant and the powerful can get away with most things, then virtue can be a recipe for disaster.

Take the case of Marlene Garcia-Esperat. She was a journalist investigating corruption in the Philippine Department of Agriculture. The corruption went deep, and it reached very high levels. In order to protect themselves, officials in the department ordered her death. In 2005, a man knocked at her door, wished her good morning, and then killed her in front of her children.

Between 1986 and 2006, fifty-six Philippine journalists were murdered, either in retaliation for their coverage or to prevent them from breaking the news of illegal activities among the wealthy elite. Garcia-Esperat’s case was unusual in only one way—it was the first in twenty years in which the murderers were brought to trial.

These sorts of tactics aren’t confined to the Philippines, of course. According to the Committee to Protect Journalists, over 800 journalists have been killed around the world since 1992. Reporters and editors—and whistle-blowers, peace activists, and others intent on exposing immorality—often end up paying the ultimate price for their bravery.

Hobbes takes a hard-eyed view of human nature, and denies that virtue is its own reward. If he is right about that, then it pays to be good only when that promises a longer life, a more secure existence, or a better chance at getting what you want. It sometimes will. But not always. When it doesn’t, Hobbesian rationality requires that you make injustice your master.

The Role of Consent

Most of us believe that we have a moral duty to honor our commitments. And a contract is a commitment—it is a promise given in exchange for some expected benefit. A social contract differs from other contracts only in the extent of the duties it imposes and the benefits it creates. Since we are morally required to keep our promises, we have a duty to honor the terms of the social contract.

---

But have we actually promised to live up to any social contract? The Pilgrims did, when they paused before the shores of Massachusetts and together signed the Mayflower Compact in 1620. In ancient Athens, free men were brought to the public forum and directly asked to promise obedience to their city—or leave, without penalty. Naturalized citizens in the United States have long been required to pledge allegiance to the nation's laws. But relatively few adults nowadays have done any such thing. It seems, therefore, that we are not really parties to any such contract, and so are not bound to obey its terms.

Some philosophers have tried to finesse this point by arguing that we actually have agreed to obey the law. True, most of us haven't signed any contract or stated out loud that we are prepared to follow the law. Instead, we have offered our tacit consent, which is expressed through silence and a lack of opposition to the government. Tacit consent is a possibility: when I ask my class whether it is okay to move on to a new topic, and no one replies, I reasonably take it that everyone agrees to proceed. Likewise, we might signal our consent to the government's laws by staying put, by not calling for its overthrow, by continuing to reap the benefits of civilized society.

But this is problematic. Some people loudly call for revolution; they are not tacitly consenting to obey the law. Others might be unable to voice their opposition freely, for fear of what the authorities will do. The fact that they remain where they are is no sign of their consent. It's simply evidence of a very practical decision. In many such cases, individual protest is unlikely to lead to better times, and is very likely to lead to imprisonment, torture, or an early death. How many political prisoners have learned this lesson the hard way? How many others have been deterred by their example?

The defender of tacit consent might reply that if people were rational, and saw the horrors of the state of nature, they would agree to being governed under the present terms, even if such terms are not ideal. And therefore, since people are, on the whole, pretty rational, we can assume that they have given at least their tacit consent to being governed by the existing laws.

Yet this is also mistaken reasoning. Suppose you make me a very generous offer, so generous that I'd be an idiot to turn it down. And yet that's just what I do. Perhaps I'm stubborn, shortsighted, or just plain stupid. You can't go on and insist that I uphold my end of the deal, since I never made one. Thus, even if it would be highly rational to consent to the social contract, that doesn't show that people have actually done so. And it is the actual consent of citizens, whether explicitly or tacitly given, that is supposed to be so important for justifying political authority, and imposing a moral duty to obey the law.

Thus it seems that many people have neither explicitly nor tacitly consented to the rules that govern their society. The reasoning here is summarized by the Consent Argument:

1. We have a duty to obey the law only if we have consented to do so.
2. Many have not given their consent to obey the law.
3. Therefore, many people do not have a duty to obey the law.

I have just tried to show that the second premise is true. Still, the argument works only if the first premise is also true. Its supporters claim that governments can be terribly abusive, and so their power can be justified only if it respects the will of its citizens. And that requires that citizens consent to being governed. An essential part of government is its power to force its people to do what it says. But as a general matter, it is wrong to coerce people without their consent. Why should it be any different when the threat is coming from the government rather than a private citizen?

That is the strongest case for premise 1. Here is the strongest case against it.

Suppose you hate your country and reject its basic laws. You remain only because your government refuses to allow you to leave or because other, better countries won't let you in. You really, truly do not consent to your government's authority. Does that mean that you have no duty to obey its rules? That you are morally free to break laws against theft and slander and battery and murder, just because you renounce your membership in the social contract? That is the implication of premise 1. It is very hard to accept.

It is even harder to accept when we turn our focus away from questions of obedience to the law and ask, instead, about basic moral duties. It is very implausible to suppose that we are morally required to do only what we agree to do. We have a moral obligation to help the needy, even if we can't be bothered to think of their plight. Abusive bosses are morally required to be decent to their workers, even if the bosses deny this and have made no promise to do so.

Contractarianism would be in deep trouble if it claimed that our moral duties applied only to those who agreed to accept them. But it makes no such claim. The social contract that fixes our basic moral duties is not one that any of us has actually consented to; rather, it is one that we each
would agree to were we all free and rational and seeking terms of mutually beneficial cooperation. So the fact that we have never signed a social contract or verbally announced our allegiance to one does not undermine the contractarian project.

Contractarianism does not require you to do whatever the existing laws and social customs tell you to do. Those standards are partly a product of ignorance, past deception and fraud, and imperfect political compromise. We are morally required to live up to the standards that free, rational people would accept as the terms of their cooperative living. It's safe to say that no existing set of laws perfectly lines up with those terms.

Thus contractarianism isn't a simple recipe to do whatever your society says. Rather, it provides a way to evaluate society's actual rules, by seeing how close (or how far) they are to the ideal social code that would be adopted if we were freer, more equal, and more rational than we are. If contractarianism is correct, this ideal social code is the moral law.

Disagreement among the Contractors

If the social contract theory is correct, then the moral rules are those that free, equal, and rational people would agree to live by. But what happens if such people disagree with one another? For instance, what if these contractors can't reach a deal about the conditions under which a nation should go to war, or about the kind of aid we owe to the very poor? What happens then?

Rawls solved this problem by making every contractor a clone of every other. Behind the veil of ignorance, all of your distinguishing features go away. No one is any different from anyone else. And so there is no reason to expect any disagreement.

But Hobbes and other contractarians won't stand for this. They can't see why I should follow the rules of someone who is so completely unlike me—a person who is not only absolutely rational but also stripped of all knowledge of his social status, his friendships and family situation, his desires, interests, and hopes. Hobbes and his followers insist that the moral rules are those that we, situated as we are, would rationally agree to, provided of course that others would agree to live by them as well.

It's not easy to know how to solve this disagreement between contractarians. On the one hand, Rawls's view is likely to be fairer, since any information that could prejudice our choices is kept from us as we select rules to live by. But Hobbes also has a point, that we want to make it rational, if we can, for everyone to live by the moral rules. Why should I live according to the rules set by some person who isn't at all like the real me? That's a pretty good question.

I'm sure that you've already figured out that I am not able to answer every good ethical question. This is another one I am going to leave for your consideration. Instead, let's return to our original problem: what should we say when the people choosing the social rules disagree with one another?

Perhaps Rawls is right, and there won't be any disagreement. But what if he's wrong? If contractors disagree, then the actions or policies they disagree about are morally neutral. They are neither required nor forbidden. That's because the moral rules are ones that all contractors would agree to. If there are some matters that they can't agree on, then these are not covered by the moral rules.

This could be pretty bad. Or it might be just fine. It all depends on where the disagreement arises (if it ever does). If there are only small pockets of disagreement, regarding relatively trivial matters, then this is hardly a problem. But what if contractors can't agree about war policy, about whether executions are just, about how to treat the poorest among us? Then this is really serious, since we do think that morality must weigh in on these issues.

So, how much disagreement will there be? There is no easy way to know. We can provide answers only after we know how to describe the contractors and their position of choice. Will they be clones of one another, situated behind the veil of ignorance? Or will they be aware of their different personalities and life situations? Will they be more or less equally situated, or are some going to have a lot more leverage than others? When we say that they are rational, do we have Kant's conception in mind? Or Hobbes's, according to which rationality amounts to reliably serving your self-interest? Or some other conception?

Answers to these questions will make a big difference in deciding on the specific moral rules that a social contract theory favors. These answers will also determine the amount of agreement we can expect from the contractors. There is no shortcut to discovering these answers. To get them, contractarians must defend their own specific version of the theory against competing versions. That is a major undertaking. Until it is done, we cannot know just what the moral rules are, or how much contractual disagreement to expect.
The Scope of the Moral Community

The true measure of a man is how he treats someone who can do him absolutely no good.

—Samuel Johnson

Who has rights? Who deserves our respect? Utilitarians have their answer: anyone (or any animal) who can suffer harm. Kantians have their answer: anyone who is rational and autonomous. And contractarians have theirs: anyone whose interests are protected by the rules that contractors will agree upon.

When coming together to negotiate rules to live by, who will the contractors decide to protect? Different social contract theorists give different answers. The key to understanding them, however, lies in the idea that the contractors are, above all, rational and self-interested. It's easy to see why they should be rational. But why assume that they are self-interested?

There is a two-part answer. First, the preliminary part: being self-interested is not the same thing as being selfish. Being selfish is having a strong concern for how well you are faring in life. Being self-interested is placing far too much importance on your own well-being relative to the interests of others. We don't have to assume that contractors are selfish. But they definitely do care about how well off they will be under the agreed-upon rules of cooperation.

Okay, fair enough. But the real question is whether we should think of the contractors as also being generous, benevolent, and self-sacrificing. And the answer that contractarians give is no. Why is that? Well, by assigning such virtues to the contractors, social contract theorists could be accused of stacking the deck in favor of moral principles that we already agree on. The attractions of proceduralism would be lost, since we would be starting our moral inquiry by making substantive assumptions about what is right and wrong. (Namely, that it is right to be generous, benevolent, and self-sacrificing, and wrong to be the opposite.) And we would also be making it much more difficult to show people why it is rational for them to obey the moral rules, since some of us are not that virtuous. Some people would take a look at the rules that a bunch of awfully nice, sweet people agreed to, and roll their eyes in disgust. There's no way that they are going to live by those rules.

The assumption, then, is that everyone is to some degree self-interested, and that it is rational to be that way.

Now back to our original question. If you are choosing from a position of equality, are free and highly rational, with a healthy dose of self-interest, who will you assign rights to? The answer is: other people like you. Contractors—those free, equal, and rational people engaged in the project of negotiating rules to live by—are the ones who will receive special treatment.

Contractors have a few defining features. First, they are both potential threats and potential benefactors. They can return our good deeds, but can also dish out some nasty treatment in response to being harmed. Second, they are, fundamentally, our equals. They have roughly the same powers as we do, including powers to help us and to hurt us. And third, we must be unable to gain anything from them without their consent. In other words, we must enter agreements with them in order to obtain benefits from them, and protection against them.

At first blush, it seems strange that membership in the moral community should be limited to contractors. But it makes good sense, once we recall the Hobbesian view of rationality. According to Hobbes, sacrifice requires compensation. When we escape from the state of nature, for instance, we give up a great many freedoms. But it is worth it, because of the promise of a better life, the sort that comes from being able to trust and rely on others.

Now here is the crucial question: if we can get what we really want, without having to sacrifice anything, then why should we make the sacrifice? If Hobbes is right, there is no answer to this question. There is no reason to make such a sacrifice.

We can get what we want from trees, from animals, from the very weak, without having to give up anything in return. And so we have no reason to treat such beings with respect. They don't meet the conditions of being a contractor. We could decide to be nice to them—we could choose, for instance, to let a chicken live, rather than kill it and eat it, or let a lab rat go free, rather than submit it to painful experiments. But that is charity. It isn't duty. We have no duties to such vulnerable beings, because our duties are limited to contractors—those we have reason to respect, because they can harm us if we don't and can benefit us if we do. We can't just take what we want from contractors. We need to give up something in exchange for their beneficial cooperation.

In short, you get moral status, have rights, and are owed respect just in case your cooperation is needed in order for others to benefit. You have to be a member of the social contract in order to have genuine moral importance. Plants aren't members, since we can use them as we like, without giving them anything in return. Ditto for animals, and the very weak among us. That is why membership in the moral community is limited to contractors. They are the only ones with whom it is rational to enter a social
contract. For all other beings, we'd be giving something up (freedom to exploit them), without gaining anything in return. According to Hobbes, that is irrational.

Thus contractarianism offers no secure protection for the truly vulnerable. We could, if we like, ensure their protection, but reason does not require us to do so, since we can get what we want from them without having to sacrifice anything in return. We are to them as a much more powerful and indestructible alien race would be to us. Such creatures, if they felt like it, might be nice to us. But since there is nothing in it for them to treat us this way, neither reason nor morality requires that they offer us their respect. They'd be perfectly within their rights to snack on us day and night.

This is because morality, on the social contract view, comes from rules of beneficial cooperation that rational parties would agree to. Rational, all-powerful aliens wouldn't agree to limit their liberty in exchange for anything we might do for them, since we can't hurt them, and they can get whatever they want from us without giving anything up on their end.

If the social contract theory is correct, then animals, ecosystems, infants, and the severely retarded are in the same position as we readers are in the fictional example I've just presented. It's very bad news for us if such a race ever pays the earth a visit. In the meantime, it's very bad news indeed for all the vulnerable among us.

Conclusion

Contractarianism starts with a very promising idea: morality is essentially a social matter, and is made up of the rules that we would accept if we were free, equal, and fully rational. The heart of the theory is an ideal social code that serves as the true standard for what is right and wrong.

This theory has a lot going for it, as we've seen. It offers us a procedure for evaluating moral claims, and so offers the promise of being able to justify even our most basic moral views. It has an interesting explanation of the objectivity of morality. It can explain why we are often bound to obey the law, and why we may sometimes break it. It has an appealing account of why we should punish criminals. It can explain why it is usually (though not always) rational to behave morally.

That's a very impressive list. Like all other popular moral theories, however, it is not perfect. There are those who are disappointed with the theory because it leaves open the possibility that immoral actions are rational. Whether this is a serious problem, however, is still up in the air, since it is very hard to know whether it is always rational to do your duty. Still, as we have just seen, the theory does have at least one truly worrying aspect. It denies that the neediest are members of our moral community, and so opens the way to their exploitation.

I want to remind you that every moral theory we consider in this book is still a work in progress. Very smart philosophers continue to develop these theories, building on their strengths and trying to shore up their weaknesses. It's no different here, when it comes to assessing the social contract theory. I haven't offered the last word on its success. I've offered only the beginnings of the full picture. Those who find its vision of morality elegant and compelling are invited to think more about how it might be supported, while fans of its competitors must do the same for their favored theory.

Let's now have a look at more of the competition.

Discussion Questions

1. Is it immoral to be a free rider? Is it irrational? Does the existence of free riders raise a serious problem for contractarianism? Why or why not?
2. How does Hobbes defend the claim that it is never rational to behave unjustly? Do you find his arguments convincing?
3. Some people might object that they never explicitly signed anything like a "social contract," and therefore cannot be bound by it. How might contractarians respond to such an objection?
4. Would a group of free, equal, and rational people necessarily all agree on a set of rules to live by? If not, is this a problem for contractarianism?
5. Do animals have rights? Do weak and vulnerable human beings? If so, can contractarianism account for this?
Ethical Pluralism and Absolute Moral Rules

The Structure of Moral Theories

All of the moral theories we have considered so far have one thing in common: they are examples of ethical monism. Monistic theories argue that there is one supreme rule that serves as the basis of all morality.

A supreme moral rule has two defining features. First, it is absolute. That means that we are never permitted to break it. If you violate an absolute rule, you have automatically acted immorally. Second, this moral rule is fundamental. There are no deeper, more basic moral rules that justify the supreme rule.

Utilitarians, for instance, are ethical monists. They insist on a single, ultimate moral rule: maximize happiness. This rule is absolute. Every act that fails to maximize happiness is wrong. And the rule is fundamental. If you ask utilitarians to justify this requirement, they will deny that any other moral rule can do so. Moral questioning, like all other lines of investigation, must stop somewhere. Fundamental moral rules mark that stopping point.

Contrast this with the moral rule that forbids children from teasing their unpopular classmates, or one that requires surgeons to use anesthesia on patients. These rules are not fundamental ones. Their justification comes from their link with a more general and basic rule, such as one that requires us to show respect to others, or to avoid inflicting needless suffering.

Almost all of the classic moral theories are monistic. They each defend a single absolute, fundamental moral rule (maximize self-interest, maximize happiness, do what God commands, act only on universalizable maxims, etc.). They then use this fundamental rule as the supreme test of morality.

The attractions of a monistic theory are clear. We naturally seek unification in our thinking, and monistic theories provide this. They can impose order on morality, and organize all moral principles by reference to a supreme moral rule. But we have reviewed the most important versions of ethical monism and have found serious problems for all of them. What to do?

There are three options to choose from: (1) we could try to discover a new version of monism that puts forward a supreme moral rule that we haven't seen before; (2) we could stick with one of the theories we have already seen, and try to perfect it by defending it against objections; or (3) we could abandon the monistic assumption that has driven so much moral philosophy. This third option is the path of ethical pluralism. We will explore its central claims in this chapter and the next.

Ethical pluralism is a family of views that holds that there is a plurality of fundamental moral rules. Thus pluralists deny that we can systematize ethics under a single rule. Some pluralists believe there are two basic moral rules; others believe that there are three or more. There are many different versions of pluralism, each one distinguishing itself by the different rules it considers fundamental.

Luckily, we can spare ourselves the effort of examining every variation (too many to count, in any event), and divide pluralistic theories into two camps. The first is that of the absolutists, who think that it is always wrong to violate the fundamental moral rules. Other pluralists reject this view. They think that it is sometimes morally acceptable to break a fundamental moral rule. Let's spend some time with the absolutists first, and then turn, in the next chapter, to their opponents.

Is Torture Always Immoral?

You might reasonably think that if there are any absolute moral rules, then a ban on torture would be among them. Let's consider a case to help sort things out.

On the evening of March 1, 2003, CIA officers deployed just outside of the Pakistani capital of Islamabad received a text message: “I am with
The initials were those of Khalid Sheikh Mohammed, mastermind of the September 11 attacks on the World Trade Center. After waiting a few hours, so as not to compromise the identity of their informant, CIA officers stormed the house and apprehended Sheikh Mohammed. He was soon flown to Afghanistan and then to Poland, where he was detained in a “black site” facility—a detention center that did not officially exist and that was run without legal oversight.

Over the next two weeks, Sheikh Mohammed was sometimes prevented from sleeping for extended periods, was slapped, was subjected to frigid temperatures, and was “water boarded” more than 100 times. Waterboarding is especially terrifying. It involves strapping a prisoner to a board and repeatedly pouring water over his mouth and nose to simulate the experience of drowning. As water fills his lungs, the prisoner almost immediately suffers a gag reflex and is overwhelmed by a feeling that he is about to die.

Waterboarding rarely results in death. It is always extremely painful, and it does sometimes kill, though it more frequently results in other sorts of harm (lasting psychological damage, lung or brain damage, and sometimes broken bones caused by struggling against the physical restraints).

In Sheikh Mohammed’s case, the purpose of such treatment was clear—to extract useful information that would lead to the capture of other terrorists and the prevention of their murderous plans. Despite serious reservations by a number of CIA and FBI personnel, the most senior U.S. officials regarded such treatment as morally acceptable. Their argument was straightforward: though waterboarding isn’t exactly a noble undertaking, it is the lesser of two evils. If faced with a choice between torturing a terrorist and saving the lives of hundreds of innocent people, it is clear which option is best.

It is interesting, though, to note how the public defense of such interrogations proceeded. Administration officials repeatedly denied that waterboarding is a form of torture. They appeared to embrace the absolutist idea that torture is always immoral. That is why they argued so strenuously that waterboarding did not qualify as torture—had they admitted it, they would have felt bound to say that their actions were wrong.

But is there really an absolute moral ban on torture? Despite widespread support for this view, it might not stand up to scrutiny. Perhaps we should accept that waterboarding is torture, but insist, forthrightly, that torture is sometimes morally acceptable—especially when many innocent lives are at stake.
This is a very powerful argument. Its first premise is certainly true, since absolute moral rules are, by definition, those that we are never allowed to break. The second premise is also very plausible. After all, what could possibly be so important about obedience to a moral rule that would allow us to sacrifice thousands of innocent people for its sake? That is a very hard question to answer. If there is no satisfactory reply, the conclusion must be true.

Notice that this argument makes no specific mention of torture. It is designed to be a perfectly general criticism of all absolute moral rules. But you might be suspicious. Perhaps torture isn't a good example. Maybe it's okay to torture people, in very unusual cases. But that doesn't settle the matter of absolutism's merits, since there might be better candidates for absolute rules. Could it ever be right, for instance, to rape someone? Or to deliberately kill an innocent person against his wishes?

Critics of absolutism will say that, yes, such actions may indeed be morally right, though these critics will also admit that any such cases would be extremely rare. For instance, if someone credibly threatens to detonate a nuclear bomb in a densely populated city, and agrees to defuse it only if we authorize the killing of an innocent person, then perhaps, morally speaking, we must agree to his terms. We should never celebrate having to torture, rape, or kill. But if doing such actions will prevent a horrible catastrophe, then critics of absolutism insist that we may be permitted, and perhaps even required, to do such things.

The Doctrine of Double Effect

Suppose that you are an emergency room physician and are faced with six patients who have just been rushed to your hospital. They were all at a dinner party and made the mistake of eating some innocent-looking mushrooms that turned out to be poisonous. Each of the patients is dying. After quickly running some tests, you discover that saving one of the patients requires giving him all of the available antidote. You also discover that you can save the other five patients by giving them each a fifth of the serum. Whom should you save?

Assuming that each of these six patients is a good person, with otherwise decent life prospects, it seems clear that you should save the five. It's not that the very needy patient deserves to die; rather, it is better that only one dies, rather than five.

We reach similar verdicts in other cases. Imagine that a runaway trolley is headed for five innocent people and that you can pull a lever that switches the trolley to a side track, where (you guessed it) one unfortunate person is trapped. Shouldn't you pull that lever?

Suppose that an important military operation can be conducted risking only one soldier's life, rather than five. If the one soldier is just as likely to complete the task, it seems clear that the right thing to do is to spare the five and send him out alone.

Reasoning in these cases, as in so many others, seems to push us directly to consequentialism. The mandate here (and in the Argument from Disaster Prevention) seems clear: minimize harm.

Yet we would also minimize harm if we were secretly to abduct a small number of healthy people, anesthetize them, and cut them up to distribute their vital organs to those who would otherwise die from organ failure. We could minimize misery by "culling" the population of those whose lives are wretchedly unhappy, with little prospect of improvement—even if they didn't want to die. We could dramatically reduce terrorism if we adopted a policy of reliably executing a terrorist's child or spouse in response. But these ways of minimizing harm are deeply offensive.

Consequentialist reasoning, so powerful in the Argument from Disaster Prevention and in the three initial cases we've considered here, seems to have led us astray. But if it is so plausible in the earlier cases, perhaps we should overcome our queasiness when it comes to the examples in the previous paragraph.

Absolutists reject that thought. Indeed, many people are tempted by absolutism precisely because they see it as the only way to resist consequentialism. But to make good on this hope, absolutists need to show how they can make sense of these various cases, without relying on hidden consequentialist assumptions. The absolutist must be able to distinguish the antidote, trolley, and military stories, on the one hand, from the murderous cases just described.

Absolutists have often relied on the Doctrine of Double Effect (DDE) to do this. The doctrine refers to two relevant effects that actions can have: those that we intend to bring about, and those that we foresee but do not aim for. This principle says the following:

- Provided that your goal is worthwhile, you are sometimes permitted to act in ways that foreseeably cause certain types of harm, though you must never intend to cause such harms.
- The DDE does not say that it is always wrong to intentionally harm others. It allows, for instance, that harmful punishment is sometimes...
acceptable. The DDE simply tells us that some harms may never be aimed for, even though such harms may be permitted as side effects of one's actions (i.e., as "collateral damage"). Which harms are these? The ones prohibited by absolute moral rules.

The doctrine of double effect, if true, would have two very important implications: (1) it would provide a reply to the Argument from Disaster Prevention, and (2) it would refute utilitarianism and all forms of act consequentialism.

A Reply to the Argument from Disaster Prevention
The Argument from Disaster Prevention advises us to impose certain terrible harms in order to prevent even more of them from occurring. Those who endorse this argument would have us set out to kill innocent people, for instance, if doing so would lessen the overall number of innocent deaths.

Against this, the DDE requires that we not aim at certain harms, even if that is the only way to prevent disaster. After all, the absolutist insists that certain acts must never be done, whatever the consequences. The DDE denies that the ends always justify the means. Certain goals are never to be pursued, even if pursuing them will help us minimize harm.

How the DDE Threatens Act Consequentialism
If the DDE is correct, then even if two actions predictably have the same bad results, one of these actions might be right and the other wrong. And that is something that utilitarians and other act consequentialists cannot allow. They determine the morality of an action based solely on its results. Any two acts with identical results must be morally equivalent.

By contrast, the DDE determines the morality of actions based partly on what is going on in the person's mind. If the DDE is correct, then some intentional harms may be immoral, even though causing the same harms while aiming at other goals may be permitted.

The DDE can be used by absolutists in the following way. Suppose, as many absolutists claim, that it is always wrong to deliberately kill an innocent person. Then it is always immoral to intend to kill a healthy patient to save others, to aim to kill an innocent child to stave off terrorism, and to seek to eliminate the deeply miserable among us. Since each of these actions involves the intention to kill innocent people, it is automatically wrong.

But by sending a soldier on a dangerous reconnaissance mission, knowing that he is likely not to return, we are aiming at some morally acceptable military goal rather than the soldier's death. In providing the antidote to five patients, we know that the neediest patient will die, but we would be delighted if he survived; we don't intend to kill him. In shifting the trolley to a side track, we are trying to save five lives, even though we foresee that one person will die as a result. These examples all involve morally acceptable actions; even though we foresee, in each case, that someone will probably die, we are aiming to do good, and do not intend to cause harm.

The DDE thus allows us to morally distinguish cases that yield identical results (in these cases, five lives saved, one lost). It does so by showing that we can respect an absolute ban on intentionally killing innocents. In drawing moral distinctions among cases with the same consequences, it directly challenges all forms of act consequentialism.

Distinguishing Intention from Foresight
So the DDE does a lot of good work for the absolutist. But there is a difficulty with the DDE, and it must be solved before absolutists can rely on it with confidence. The difficulty is that we lack a clear basis for distinguishing between intention and foresight. Without clarity on this point, the DDE will either fail to provide guidance about the morality of actions or will give us results that seem deeply mistaken.

Consider this challenge. Those who secretly abduct and carve up innocent people to distribute their organs could say that they intend only to save many innocent lives. They would be delighted if their innocent victims were (miraculously) to remain alive after the operation. Therefore, they don't intend to kill their victims. They merely foresee their death. Thus the DDE does not condemn their actions.

It is hard to imagine someone saying this with a straight face. But explaining precisely what is wrong with such a claim is not easy. It requires us to sharply define intention. Further, this definition must clearly distinguish intention from foresight, and also help us to see why intending harm is so much worse than foreseeing it. Can this be done? Have a look at these attempts:

(A) You intend to do X = You want X to occur as a result of your action.

But the man carving up the kidnapped victims may not want them to die. He may want only to save the lives of the many patients who need
these organs. So according to (A), this man does not intend to kill the abducted patients. But he surely does, and that makes (A) implausible.

(B) You intend to do X = X is part of your plan of action.

Consider another variant on the trolley case. Here, the runaway trolley is heading toward five people, but there is no spur. The only way to stop the train is by pushing a huge bystander onto the tracks at the last minute. His bulk will stop the train—though he will surely die as a result. Here again, we save five at the cost of one. But this leaves an awfully bad taste in the mouth.

Yet if I were to push this guy, I could deny that his death was part of my plan. My plan was limited, let’s say, to pushing this man and to stopping the train. I’d be pleased if the man were to escape with only bruises. According to (B), I didn’t intend to kill the man. But I did. So (B) is problematic.

(C) You intend to do X = You would regret it if X didn’t occur as a result of your action.

Consider the last trolley case again. It seems clear that I intentionally killed the man I pushed to the tracks. But I would not regret it if he survived. Therefore, by (C), I did not intend his death. Again, something has gone wrong.

(D) You intend to do X = X results from your actions in a nonaccidental way.

The problem here is that all merely foreseen results will now become results that we intend to produce. When the ER doctor gives the serum to her five patients, one patient will die. The doctor knows this. And it isn’t an accident. Therefore, by this definition, the doctor intends that she die. And that, too, seems mistaken.

(E) You intend to do X = You must cause X if you are to achieve your goals.

In the second trolley case, it is false that the huge bystander’s death must occur if I am to achieve my goals. All that must occur is that he stop the train with his body. And so, with (E), I do not intend his death. And so the DDE does not condemn my action. But my action is surely condemnable.

These aren’t the only possibilities for defining what it is to intend to do something, but it’s been a very difficult task for absolutists to provide a definition of intention that manages to track the moral distinctions that we feel so confident about. So if you are a fan of the DDE, here is your task: clarify the distinction between intended and merely foreseen results, and do so in a way that shows why some intentional harms, just by virtue of being intended, are morally worse than harms that are foreseen. Perhaps it can be done. But it won’t be easy.

Moral Conflict and Contradiction

For those who find ethical pluralism attractive, an invitation: put together your preferred list of moral rules. Once you’ve completed the task, consider this question: what happens if these rules ever conflict with one another? If each of them is absolute, then moral conflict leads to contradiction. That is a very bad thing.

Consider a very simple case. Suppose that the correct list of absolute moral rules includes these two: keep your promises, and don’t deliberately harm innocent people. Now imagine that someone has done you a great kindness. As a gesture of thanks, you promise to help him whenever he needs it. He smiles, and then asks you to make good on your word by breaking into his rival’s home and beating him senseless. The rival, let’s suppose, is an innocent. He’s done nothing to deserve such a beating.

In this case, you are morally required to keep your promise. But in doing that, you’d also be acting immorally, since you would be violating the rule against harming innocents. If you instead avoid hurting the innocent rival, you will be doing what is required of you. But this would also be forbidden, since it would involve breaking your promise. Either way you go, your action is both morally required and forbidden. That is a contradiction.

It’s a simple case, as I’ve said. But it is meant to illustrate a crucial worry for pluralist theories that endorse absolute moral rules. When such rules conflict, the theory yields contradictory advice. And that will sink the view, since contradictions are fatal flaws for any theory. The Argument from Contradiction summarizes this challenge:

1. If there is more than one absolute moral rule, then they are bound to conflict at some point.
2. If absolute rules ever conflict, then this generates contradiction.
3. If a theory generates contradiction, then it is false.
4. Therefore, any theory that endorses the existence of more than one absolute moral rule is false.
Premises 2 and 3 are true. They won’t attract any challenges from philosophers. The real debate focuses on premise 1. If you believe that there is more than one absolute moral rule, then you have to show that the rules will never, ever conflict.

There is a way to do this. We will have to assume that absolute moral rules have a certain limitation: they forbid us from acting in specific ways, but they never require us to act in any way at all. We may never do certain things—rape, torture, and terrorize, for instance. These rules, and others, can be honored entirely through inaction. So long as all absolute rules can be obeyed by doing nothing, then absolute rules will never conflict.

This means that most of the familiar moral rules cannot be absolute, since they require us to act in certain ways—perform easy rescues, prevent disaster, protect our children from harm, keep our promises. If moral rules require us to do things, rather than merely refrain from action, then they might require us to do incompatible things. That is the kind of conflict that leads to contradiction. If, instead, all absolute moral rules can be satisfied merely by sitting on our hands and doing nothing, then contradiction can be avoided.

Is Moral Absolutism Irrational?

Many people think that intentionally killing innocent people is never morally acceptable. What could explain this? Presumably, the incredibly important value of innocent human life. But if this is of paramount importance, then why shouldn’t we kill an innocent person if we could save more innocent lives by doing so?

Optimists will say that such a thing could never happen. But it could. In 1961, a man approached the chief rabbi of Warsaw, Shimon Efrati, and asked a question that had been troubling him for many years. This man was among a group of Jews who had hidden in a ghetto bunker during World War II, trying to avoid the Nazi patrols intent on killing them. There was a crying baby in the hideout. Someone pressed a pillow over the baby’s face, in order to quiet the baby, to no avail. One of them wanted to smother the baby, but the rabbi’s brother intervened and prevented it. As a result, the baby’s cries led soldiers directly to the hideout. Rabbi Efrati’s brother, along with nineteen others, were rounded up and summarily executed.

Cases like these can make it seem irrational to defend an absolute ban on killing the innocent, since we can sometimes better protect innocent human life by violating this ban. That shows that the ban should not be absolute. The charge can be put in the form of an Argument from Irrationality:

1. If perfect obedience to a rule can frustrate the underlying purpose of the rule, then the rule is irrational.
2. Perfect obedience to any absolute moral rule can sometimes frustrate its underlying purpose.
3. Therefore, absolute moral rules are irrational.

This may look a bit like the Argument from Disaster Prevention, but there is an important difference. The charge here isn’t that following absolute rules may produce a catastrophe. Rather, the complaint is that there is something fundamentally inconsistent about the absolutist position.

It is tempting to defend absolute rules by claiming that they protect all-important values, such as the value of innocent life. But if these values can be better served by violating those rules, then the rules should be broken. And that means that they aren’t really absolute, after all.

Absolutists have replied to this challenge by rejecting the argument’s second premise. To see how they do this, consider again an absolute ban on killing innocents. It’s natural to think that the point of such a rule is to protect innocent life. But absolutists deny this. If our goal is to minimize the loss of innocent human life, then we should sometimes deliberately kill an innocent person, since that will best achieve our goal. But certain absolutists think that we should never, ever kill another innocent human being—even if doing so will thereby spare many more innocent people from being killed.

But if the point of a ban on killing innocents is not to save innocent life, then what is it? The answer is simplicity itself. The point of such a ban is to forbid you from killing innocent people. The only way to honor that demand is by not killing innocents. Of course, it may be (as it was in the
case of Rabbi Efrati's brother) that by obeying this requirement, you thereby open the door to a situation in which many more innocent people are killed. But the absolute requirement is not that you prevent the killing of innocents. It is that you kill none of them yourself.

In other words, the fundamental rationale for absolute moral rules is to forbid people from acting in certain ways, rather than to minimize the violation of these rules.

How can such a view be defended? The easy way is closed to us. The easy way tells us that innocent life is of the greatest importance, and so must be protected via an absolute rule. As we have seen, that way won't work, because this value can sometimes be better served by violating the rule against killing. That's what happens when we must kill one innocent person in order to save many others.

What we need instead is a defense of this key idea:

(A) We are always forbidden to act in certain ways, though we are not always required to prevent such acts from occurring.

Absolutists have found a way to defend claim (A). It is called the Doctrine of Doing and Allowing.

The Doctrine of Doing and Allowing

At the finale of *Batman Begins*, Christopher Nolan's first movie about the comic book hero, Batman and his arch nemesis Ra's Al Ghul are having their climactic battle aboard an elevated train. The train is about to plunge hundreds of feet to its destruction. Batman has finally pinned his enemy and could deal the killing blow. But he doesn't. Instead, the last words that Ra's al Ghul ever hears are these: "I'm not going to kill you. But I don't have to save you."

Batman's words reveal a commitment to a view that absolutists have long relied on. This is the Doctrine of Doing and Allowing (DDA):

It is always morally worse to do harm than to allow that same harm to occur.

It is worse, for instance, to kill than to allow victims to be killed; worse to be a terrorist oneself than to allow others to perpetrate terrorism.

If it is always worse to do bad things than to allow them to occur, then we have a defense of the idea that absolute moral requirements apply only to what we do, and not to what we allow or fail to prevent. If the Doctrine of Doing and Allowing is true, we may be absolutely forbidden from killing, torturing, or raping, even though we are not absolutely required to prevent such behavior.

The DDA can therefore explain why there is something especially problematic about doing evil yourself. It can support the idea that you must keep your hands clean, even if doing so lets others cause even greater harm. The DDA directly supports principle (A), and is therefore essential to a defense of absolutism.

The Doctrine of Doing and Allowing thus allows us to deal with an especially tricky kind of moral dilemma—cases in which you are faced with a choice of doing something truly awful, or refusing to do so, knowing that your refusal will allow a less scrupulous person to take your place and do far greater harm.

Consider the case of certain Nazi military officers who came to view their cause as deeply unjust. They had much to fear, for if their views became known, they would be shot. If they resigned or sought to run away and were captured, they would also be shot. Apart from such fears, however, another consideration kept some of them from leaving their posts.

These officers often correctly thought that if they didn't follow orders, then some true believer, with no doubts about the Nazi program, would replace them. And that would be even more disastrous.

By remaining in their positions, these officers were aiding an evil cause. But they held the view, shared by many in situations like theirs, that the best way to try to destroy a morally bankrupt institution was to work from within. The problem, of course, is that one must often do evil to remain an insider. Immoral groups usually test the loyalty of their members, and this requires them to do all sorts of terrible things. Those who end up following orders often justify their cooperation with evil by arguing that any alternative would bring about even greater harm. And they may well be right.

Together with moral absolutism, the DDA forbids certain actions, without requiring that you prevent others from doing them. On the safe assumption that Nazi atrocities were evil, the DDA would forbid German officers from committing them. It would require those officers to step down from their posts, even though, in doing so, they were signing their own death warrant, and effectively allowing others to do even greater damage.

We are sometimes forced to choose between doing actions that will stain our lives forever, and refusing to do so, knowing that our refusal will create an opportunity for other people to do their worst. In such cases, the DDA requires that we abstain from evil, even if this means that more
people get hurt or that our own life is thereby placed at greater risk. For those who favor the DDA, some things are more important than minimizing harm to others, or even remaining alive. Preserving our moral integrity is one of them.

But is the DDA true? It may well be. Here are two cases that reveal its attractions.

**Case 1:** I am morally allowed to eat at a decent restaurant, spending thirty dollars on the dinner—even though, with that money, I could have prevented the death of three starving Somali children by sending a check to UNICEF. Most of us think it acceptable to spend the money on dinner, thereby allowing those children to die. Yet it would definitely be wrong to kill them directly.

**Case 2:** I am a soldier on the battlefield and see a fellow infantryman shot at my side. I can't tell whether his wound is fatal. He is groaning and asking for help. It would definitely be wrong to shoot that soldier. It would not be wrong to let him die, if I had to ignore his pleas in order to obey a command to retreat from the battlefield.

We are forbidden from doing something in both of these cases, though permitted to allow it to happen. The Doctrine of Doing and Allowing perfectly explains why this is so.

But some have had their worries about the DDA. Consider these two cases:

**Case 3:** I am a nurse charged with giving a bedridden patient a life-saving pill every four hours. I am an evil nurse, however, and when the appointed time comes, I stand by, pill in hand, and do nothing, thereby allowing the patient to die. Suppose instead that I had obtained a poison pill and had given him that, rather than his real medication. He dies as a result. If the DDA is true, then giving the poison pill is morally worse than deliberately withholding the medicine. Is it?

**Case 4:** I am a switchman who notices a runaway trolley speeding down the tracks, headed for one innocent person trapped in a narrow pass. I pull a lever and switch the tracks so that the trolley heads off on a spur. I do this because five people are on that spur and I want to kill as many people as I can. They all die. Now suppose, instead, that the runaway trolley is headed for the five rather than the one, and I just stand there, gleefully passing up an easy chance to switch the trolley to the track with only one person on it. The DDA says that my action is morally worse than my omission, that pulling a lever is morally worse than not pulling it—even though both cases result in the same number of deaths, and in both I have the same motive, intentions, and knowledge of the likely outcomes.

These are all very schematic, underdescribed cases. Some of them are quite outrageous. But there is a point to relying on examples like these. We can appreciate it by thinking about the nature of scientific experiments. The ones that are well designed often place two groups in identical circumstances, and change just one variable, to test for its importance. For instance, we offer a control group a placebo, and then test a new drug by seeing how members of a comparison group fare when taking it. This allows us to isolate the drug’s powers (or lack of powers).

The tests we conduct in ethics are thought experiments. We think of different situations that are identical in all respects but one, and then ask whether that difference makes any moral difference. That is what is going on in the cases just described. Each case presents two scenarios that are perfectly similar in every way but one. In the first scenario, the person does something very harmful, but in the second, the person allows that same harm to occur. Keeping everything else the same enables us to filter out any distracting, irrelevant details that could skew our responses to these cases. We can then determine whether the difference between doing and allowing, in and of itself, is morally relevant.

The problem for the DDA is that it sometimes seems, as it might in cases 3 and 4 (and other easily constructed examples), that the mere difference between doing and allowing has no moral importance at all. That is a serious challenge to the DDA. But of course your views on these cases may differ from mine, and you might feel strongly that doing the harm is, in each case, worse than failing to prevent it.

Even if that is so, however, there is another potential problem for the DDA: the distinction between doing and allowing is actually very hard to draw. Consider the classic case of “pulling the plug” on a patient whose life is being maintained by a ventilator. It seems that this is a matter of doing something—removing a tube or flipping a machine’s switch. The doctor or nurse is not just standing there, stock still. But many have argued that removing such life support is merely letting nature take its course—in other words, not doing anything at all, but rather allowing some ongoing chain of events to continue on its way.
Before we can apply the DDA, we need to have a plausible way to distinguish doings from allowings. I don’t know how to do this in a general way. But there are many easy cases, ones in which an action counts very clearly as doing something, or an inaction counts as obviously allowing something to occur. Perhaps this is enough to give absolutists hope that we can someday formulate a criterion that will enable us to distinguish doings from allowings once and for all.

The point of investigating the merits of the DDA is to examine whether the absolutist position can be defended against the charge of irrationality. Absolutists can defend against this objection if they can show why we must never commit certain harms, even if doing so would reduce the number of those harms. The DDA is meant to provide this piece of the puzzle. It tells us that doing harm is morally worse than allowing that same harm to occur. Whether the DDA is plausible will depend, in the end, on whether absolutists can supply a test for distinguishing between doing and allowing, and whether the DDA is immune to counterexamples of the sort that cases 3 and 4 seek to provide.

**Conclusion**

When I reflect on my own moral views, I find it hard to resist the thought that certain kinds of actions just should never be done. At the top of my list is murderous terrorism—deliberately trying to kill civilians, with the aim of inspiring fear and thereby furthering some political goal. When I vividly consider such behavior, I can’t help but feel deeply repelled and outraged. I’m inclined to think that terrorism is always immoral.

But I know enough about myself to recognize my fallibility. My sense of outrage is not a surefire test of morality. Perhaps terrorism, in rare cases, is morally acceptable. Ditto for other familiar cases of repugnant behavior—rape, for instance, or torture. Whether such practices are always wrong depends on whether absolutists can adequately defend against the Argument from Disaster Prevention, the Argument from Contradiction, and the Argument from Irrationality.

The worry about contradiction is the most serious, for any theory that generates contradictions is certainly false. So absolutists must show that their favored moral rules will never conflict. The only way to ensure this is to restrict the sort of things that are absolutely forbidden to us. There are two ways to do this.

First, we might be absolutely forbidden to *intend* certain harms. And, second, we might be absolutely forbidden to *do* certain harmful things. But why is it so important to refrain from intentional harms, or from doing harm—especially if what we intend or do will reduce the harms in question? The DDE and the DDA are designed to provide an answer. The fate of absolutism hangs on whether these doctrines can be successfully defended.

**Discussion Questions**

1. How does ethical pluralism differ from ethical monism? Which view seems more defensible to you, and why?
2. Do you think it would be morally permissible to kill an innocent person to save 1000 innocent people? Defend your answer.
3. What is the doctrine of double effect, and how does it threaten consequentialism? Do you find the doctrine to be plausible? Why or why not?
4. Why might the view that there are multiple absolute moral rules generate a contradiction? How can ethical pluralists defend their theory against this possibility?
5. Is doing harm always worse than allowing harm? Is it always possible to draw a line between the two?
CHAPTER 16

Ethical Pluralism
Prima Facie Duties and Ethical Particularism

Ross's Ethic of Prima Facie Duties

Every moral theory we have considered thus far is absolutist. Most of these views are monistic, defending the idea that there is just a single absolute moral rule. But as we saw in the last chapter, some absolutists reject monism. They think that there are a number of moral rules that may never be broken. It's now time to take a look at another option. These are the theories that reject both monism and absolutism.

Such theories are pluralistic; they endorse the existence of at least two fundamental moral rules. And each of these rules is nonabsolute; in some cases, it is morally acceptable to break them. The Oxford professor W. D. Ross (1877–1971) was the philosopher who first developed this version of pluralism. He had a special term for these nonabsolute rules. He called them principles of prima facie duty, and we will stick with that label in what follows.

A prima facie duty is an excellent, nonabsolute, permanent reason to do (or refrain from) something—to keep one's word, be grateful for kindnesses, avoid hurting others, and so on. As Ross saw it, each prima facie duty is of fundamental importance. None of these duties can be derived from one another, or from any more basic principle. Crucially, each prima facie duty may sometimes be overridden by other such duties. Though there is always good reason, say, to keep a promise or prevent harm to others, morality sometimes requires that we break a promise or do harm. Likewise for each of the other prima facie duties.

Ross was convinced that absolutism in all of its forms is implausible. Those that endorse more than one absolute rule are bound to yield contradiction. Those that endorse only a single absolute moral rule are too narrow, and fail to see that there are a number of independently important moral considerations. For instance, while Ross accepted the utilitarian emphasis on doing good and preventing harm to others, he also agreed with Kant that justice was morally important in its own right.

Ross identified seven prima facie duties, each of which is meant to represent a distinct basis of our moral requirements:

1. Fidelity: keeping our promises, being faithful to our word.
2. Reparations: repairing harm that we have done.
3. Gratitude: appropriately acknowledging benefits that others have given us.
4. Justice: ensuring that virtue is rewarded and vice punished.
5. Beneficence: enhancing the intelligence, virtue, or pleasure of others.
6. Self-improvement: making oneself more intelligent or virtuous.
7. Nonmaleficence: preventing harm to others.

Ross made no claim to have provided a complete list. He allowed that there might be other prima facie duties. But each of these seven duties, he thought, definitely did belong on the list.

The term prima facie duty can be misleading. That's because these things are not really duties, but rather permanent moral reasons that partly determine whether an action truly is, in the end, morally required. To say, for instance, that there is a prima facie duty of beneficence is to say the following:

1. There is always a strong reason to benefit others.
2. This reason may sometimes be outweighed by competing reasons.
3. If this reason is the only moral reason that applies in a given situation, then benefiting others becomes our all-things-considered duty—in other words, what we are really, finally morally required to do in that situation.

Focus for a moment on the first item. It provides us with a way to test Ross's specific roster of prima facie duties. Suppose that there are situations in which there is no reason at all to benefit others. If that were so, there would be no prima facie duty of beneficence.
I will let you do the testing yourself, because I am most interested in the general theory of prima facie duties, rather than in any specific version of it. Even if Ross's group of seven rules includes too much, or too little, this would not undermine the ethic of prima facie duties. What it would show (and this would certainly be important) is that Ross's own list was off base. But a better list might make the cut.

So let's instead consider the big picture, and reveal the attractions, and difficulties, of the general model of morality that Ross advanced. First, as usual, the attractions.

The Advantages of Ross's View

Pluralism

The greatest attraction of the ethic of prima facie duties is its ability to accommodate our sense that there is, indeed, more than just a single fundamental moral consideration. To Ross, and to most of the rest of us, it does seem that the very fact of our having promised to do something generates some reason to follow through, even if keeping our promise fails to bring happiness, reward virtue, prevent misery, or do anything else. That we have given our word is reason enough to do what we have promised.

But no one believes that promising is the only thing like this. There does seem to be something immoral, for instance, when someone repays a kindness with ingratitude—even if, in unusual circumstances, being ungrateful is the right way to go.

Whether or not you agree with the whole of Ross's list, you may well sign on to the idea that fidelity and gratitude, at the very least, each possess independent moral importance. If you do, that is enough to force a shift away from monism.

We Are Sometimes Permitted to Break the Moral Rules

Ross's position also easily explains the widespread belief that the moral rules may sometimes acceptably be broken. There is always something to be said in favor of keeping a promise—but I should break my promise to meet a student for coffee if my daughter has a medical emergency and needs to be taken to the hospital. We all accept that there are circumstances in which it is morally acceptable to break a promise, allow harm to others, pass up a chance at self-improvement, and so on. Ross's theory straightforwardly explains this.

Moral Conflict

The ethic of prima facie duties also appears to make good sense of our experience of moral conflict. Duties conflict when they can't all be fulfilled. On absolutist views, such conflict yields contradiction. But Ross's theory easily avoids this.

Consider the case of a poor single mother whose child is too sick to go to school. The mother has a duty to report to work. By taking the job, she has promised to reliably show up as scheduled. But suppose that she has just moved to town, has no friends or family there, and isn't allowed to bring her child to work. She also has a duty to care for her child, especially if no one else is available to do so. What should she do?

The Rossian can say of such a case that there is a conflict of prima facie duties. There is a strong case for showing up to work. But he also has a duty to care for her child. Sometimes we can't do both. But no contradiction occurs, because we can distinguish between a standing reason (a prima facie duty) to do something and an all-things-considered, final duty to do it. When these final duties conflict—when we say, in the end, that you are absolutely required to show up at work and are also absolutely required to care for your child—then there is contradiction. Ross's view avoids this problem entirely.

Consider a district attorney who has evidence of a child molester's guilt. The problem is that the police obtained the evidence without a search warrant. Let's assume that the evidence is watertight. Not only that, but in this case, there is every reason to think that this man is going to repeat his crimes if he is released. The DA can doctor the paperwork to cover up the procedural error. He has a duty not to do so. But he also has a duty to prevent crime, and by tampering with the evidence a bit, he can do just that.

Perhaps this strikes you as an easy case rather than a hard one. If that is so, Ross has an explanation for that, too: though there is a prima facie duty, say, to obey the law and a prima facie duty to prevent harm, it is clear (if this really is an easy case) that one of these is stronger than the other. Recall that a prima facie "duty" is not really a duty, but rather a permanent, very strong reason to do something. Such reasons need not win the day in every case.

I'm not intent on defending a specific verdict in this example. If Ross is correct, the key thing is that context will determine just how important a prima facie duty is. The consideration at the heart of such a duty (promise keeping, preventing harm, righting one's wrongs, etc.) is always morally
Another way in which Ross's theory very nicely handles moral conflict is in its view of moral regret. When moral claims conflict, and we can't honor them all, we think that it is right to feel regret at having to give up something important. Regret is evidence that something of value has been sacrificed. When prima facie duties conflict, and one takes priority over the other, the lesser duty doesn't just disappear. It still has some weight, even though in the circumstances it is not as morally powerful as the conflicting duty. Regret is our way of acknowledging this forsaken duty, our way of recognizing that something of value was lost in the conflict.

Indeed, this provides us with a reasonable test for knowing what our prima facie duties are. The test is simple: there is a prima facie duty to act in a certain way only if it would always be appropriate to regret our failure to act that way. If there were nothing valuable about gratitude, for instance, then missing a chance to express it would not be a cause for regret. But it is. And that shows that there is something important about gratitude, even if it isn't all-important. That's just what Ross believed.

Addressing the Antiabsolutist Arguments
Ross's view also provides a direct reply to all three of the antiabsolutist arguments in the previous chapter. The Argument from Contradiction is easily handled, as we've seen. For Ross, conflict among moral rules does not entail contradiction, since the moral rules that he favors are not absolute.

Ross's view can also make quick work of the Argument from Disaster Prevention. This argument claims that any moral rule may be broken if that is what it takes to prevent a catastrophe. And therefore, no moral rules are absolute. Ross naturally agrees with this. None of his moral rules is absolute. When the stakes are high enough, each of them may acceptably be sacrificed.

The Argument from Irrationality charges that absolutism is inconsistent, since the values at the heart of its rules can sometimes be better served by violating those rules. Ross can agree with this criticism as well. If we must break a promise in order to ensure that many more are kept, Ross can allow that this promise ought to be broken. The charge of irrationality stems from the absolutist claim that certain rules must be obeyed no matter the consequences. Ross rejects this absolutist claim.

But Ross also denies the push to consequentialism that lies at the heart of the last two arguments. Both of them try to show that the morality of our actions always depends on their results. Think of those two arguments like this: if obeying a rule leads to a catastrophic outcome, or results in greater violations of that rule, then that rule cannot be absolute. These are consequentialist reasons for rejecting absolutism.

Ross believed, of course, that the moral rules are not absolute. But he did not get there by assuming, with consequentialists, that our moral duty is always to maximize good results. Though he agreed with utilitarians that results are morally important, he denied that they are all-important. Doing justice, for instance, or improving oneself, is sometimes more important than doing what is optimific.

Indeed, to make his case against consequentialism, Ross had us imagine a situation in which we are faced with a choice. We can benefit person A or B. We can benefit person A by fulfilling our promise to him. Or we can benefit person B just slightly more, though we have made no promise to him. If we benefit B, we break a promise. Further, B has no expectation that we will benefit him. Ross thought it obvious that we ought to keep our promise to A, even though we would do more good by benefiting B.

This thought experiment convinced Ross of two things. First, there is a prima facie duty of fidelity. There is always something morally important about keeping our word. And second, consequentialism is mistaken, since this is a case in which one option (benefiting B) produces the most good, but is morally wrong. So, while Ross agrees with the conclusion of the antiabsolutist arguments, he denies that we should be led to consequentialism as a result.

A Problem for Ross's View
In Ross's view, preventing harm is always morally important. Sometimes it is the most important thing you can do. But not always. Seeing that the guilty get their just deserts is also, and always, very important. If Kant is right, it always takes priority over preventing harm. If utilitarians are right, it never takes priority. If Ross is right, it sometimes does, and sometimes doesn't.

This leads us naturally to what may be the hardest problem for Ross's view. Ross denies that there are any absolute moral rules. So each moral rule may sometimes be broken. But when?

The easiest way to answer that question would be to create a permanent ranking of the rules, by placing them in order from least to most...
morally important. Whenever a lower ranked rule conflicts with a higher ranked one, the higher rule wins out, and determines our moral duty.

Ross rejects this strategy. He thinks that there is no fixed ranking of the various prima facie rules, no permanent ordering in terms of importance. And he is not alone in this. Though a ranking system is possible in principle, in practice no one has ever made it work. Sometimes it is morally more important to be grateful than to prevent harm. But not always. Sometimes it is more important to be honest with people than to spare them the hurt feelings that honesty may cause. And sometimes not. You get the picture.

The problem is that if we can't provide a fixed ranking of moral principles, then it isn't clear how we are to decide what to do when they conflict. That is because none of the prima facie duties has any kind of built-in moral weight. They are always important. But just how important? That depends on the specifics of the situation. Yet there are no guidelines that we can use from case to case to help us to know when a prima facie duty takes precedence over a competing duty. If a duty is sometimes, but not always, more important than another, then how do we know which one to obey when we cannot obey them both?

This is an extremely hard question. But before we can answer it, it seems we must answer an even harder one: How can we know which prima facie duties are real and which are mere pretenders? For instance, is there really a prima facie moral duty of self-improvement? Ross thought so, but many people think that letting oneself go isn't a moral failing at all. How do we settle the matter? It seems we must first know the true list of prima facie duties, before we can get to the more specific question of how to strike an appropriate balance when prima duties conflict.

**Knowing the Fundamental Moral Rules**

Here is one of the hardest problems in ethics. How can we know what the fundamental moral rules are? The standard way of justifying a rule is not open to us here. We cannot cite a more general rule to back up the one in question. If the rule is really fundamental, then there are no deeper rules from which it derives its force. When we call such a rule into question, how can its correctness be defended?

Traditionally, there have been three strategies for dealing with this very hard problem: skepticism, **coherentism**, and appeals to **self-evidence**. Let's consider them in turn.

**Skepticism**

The skeptical strategy denies that we can know what the fundamental moral rules are. We can't have such knowledge because we can't know that any moral rule is correct. That's a pretty extreme claim. How can such skepticism be defended?

Fans of this strategy say that every moral rule needs some defense—no moral rule is beyond question. True, we can defend a rule by introducing another rule to support it. But this supporting rule itself can be questioned. We can defend it by bringing in a third rule. But that third rule can also be questioned. The worry is that this sort of questioning can go on forever. And if that is true, then we can't know that any moral rules are correct.

Consider: What's wrong with teasing children? It humiliates them. What's wrong with humiliating children? It is emotionally painful. What is wrong with imposing emotional pain? It is a form of harming people. What's wrong with harming people? And so on. In the real world, such questioning always comes to an end. But that's not because we have arrived at a secure stopping point. It's just because people get impatient, or exhausted, or stumped. But without those shortcomings, the questioning would never stop. Any moral claim you put forward as a defense of another moral claim can itself be questioned, and on, and on ... forever.

Philosophers call this unhappy kind of situation an **infinite regress**. It is a never-ending chain of questions and answers. The problem is that since there is no stopping point, none of the claims along the way can be justified. We are justified in believing in a moral rule only if we can defend it. A defense requires that we be able to have an anchor, some moral rule that can end the regress because the rule is beyond question. But no moral rule is beyond question; every single moral rule requires support. If the line of questioning can go on forever, then we are not justified in believing in any moral rule, no matter how clear or obviously true it seems to us. And that means that we can never know that any moral rule is correct.

**Coherentism**

A second option is more optimistic. On this view, known to philosophers as **coherentism**, we can justify any moral claim (including a fundamental moral rule) by showing that it receives support from, and lends support to, a large number of our other beliefs. If a belief coheres well with many other things we already believe, then it is to that extent justified. And if that
belief is true, then (apart from some unusual cases) it will also count as knowledge.

So, for instance, we could regard the belief that it is prima facie wrong to harm someone as very well justified. That's because this belief is going to support, and be supported by, a lot of our other moral beliefs. If this moral rule is correct, and coherentism is true, then we can know that harming others is prima facie wrong.

There is a very old worry about coherentism—namely, that it approves of circular reasoning. Circular reasoning amounts to defending some belief by a set of other beliefs whose justification ultimately traces back to the original claim in question. Really, it amounts to using a belief to justify itself, and that is very suspicious.

According to coherentism, a belief will be justified only if it is supported by many other beliefs. But in order to support the original belief, these other beliefs have to be in good standing. They also need to be justified. And how will that happen? By their receiving support from other beliefs, including, ultimately, the original belief in question. And that is circular reasoning, which (according to critics) never justifies anything.

After all, no one thinks that the following line of reasoning justifies anything:

- Abortion is immoral.
- Why?
- Because it kills a fetus.
- Why is killing a fetus immoral?
- Because that would be aborting it, and abortion is immoral.

Abortion may be immoral, but this reasoning can't show it so, and that is because the original claim in question is used to defend itself. That is circular reasoning.

Coherentists reply that if the circle is large enough, the beliefs included in it may indeed be justified. When a belief partly supports many other beliefs, which support many others, some of which are supported by the initial belief in question—what we have is a broad network of mutual support with a wide variety of beliefs reinforcing others. For some especially well established beliefs (e.g., that there is a physical world; that I have been alive for more than one day; that there is a prima facie duty not to cause intense physical suffering), there may literally be hundreds of other beliefs that support them, and are supported by them. This kind of mutual reinforcement creates a powerful web of beliefs; each strand (i.e., each belief) is justified precisely because of its reinforcing links with many other strands.

There is a great deal of debate within philosophy about the merits of the coherentist project. Rather than pursue the matter, let me note simply that coherentism, if true, makes Ross's theory quite compelling. A great many of our moral beliefs depend on the idea that there are always excellent reasons to keep our promises, right wrongs, avoid harming others, and so on. And these prima facie duties also receive a lot of support from other beliefs, including many of our beliefs about what is morally important in specific situations. There is a broad network of mutually supporting beliefs that contains Ross's principles of prima facie duty.

Further, the thought that these duties have different weight in different contexts—another essential feature of Ross's view—also receives strong support from our considered moral beliefs. So if coherentism is correct, we may well have knowledge of many fundamental moral rules.

Self-Evidence

But this wasn't the picture of moral knowledge that Ross preferred. He regarded his seven principles of prima facie duties as self-evident. A claim is self-evident just in case it is true, and adequately understanding it is enough to make you justified in believing it. Self-evident truths are those that you are justified in believing on the basis of careful reflection alone. If you think hard about such claims, and come to believe them as a result, then you will have knowledge.

I think that there are some self-evident claims. Here are a few:

- All bachelors are unmarried.
- If Alice is taller than Bob, and Bob is taller than Charlie, then Alice is taller than Charlie.
- Anything that happened a decade ago occurred prior to today's events.
- Uncles have (or had) siblings.
- The sum of any two odd numbers is even.

Some of these claims are just obvious; others may take a bit of time to sort out. Self-evident claims need not be obvious. What is crucial is that careful reflection is all it takes to know them.

Suppose that some moral rules are self-evident. Then we have a way of calling a halt to an otherwise infinite chain of moral questioning. Our stopping points will be self-evident claims that require no further justification.
If Ross is right, then all seven of his principles are self-evident. We can know them just by thinking about what they really stand for. If we can rid ourselves of distorting influences—such things as bias, hasty judgments, and overemotional involvement—we will be convinced that there is always something right about keeping promises, preventing harm, doing justice, showing gratitude, and so on.

**Self-Evidence and the Testing of Moral Theories**

Ross thinks that his theory of prima facie duties, and his confidence in their self-evidence, is in deep harmony with common sense. And as he sees it, this is a great benefit of his theory. We should not overturn the biddings of common sense just because it conflicts with a pet theory.

Ross used the example of beauty to establish this point. Many of us feel sure that the *Mona Lisa* is a beautiful work. We should not abandon our belief in its beauty just because some theory of art declares that only Impressionist paintings or medieval altarpieces are really beautiful. We should give up the theory before tossing aside our deepest, most secure beliefs.

What is true of our artistic judgments is also true of our moral ones. We can see how this plays out by considering Ross’s rejection of consequentialism. Ross was quite clear-eyed about how tempting consequentialism can be. But he insisted that it was fatally flawed because it failed to appreciate the variety of fundamental moral concerns. Consequentialism imposes order, system, and a unifying principle onto our moral thinking. But he argued that we must resist such charms, because they conflict with our deepest beliefs about what is truly morally important. Our confidence in the independent value of promise keeping—or justice, or repairing our wrongs—should not be held hostage to a theory’s demands.

If Ross is right, we use our deepest commonsense beliefs, some of which will be self-evident, as the way to test moral theories. Our self-evident beliefs have a kind of priority in moral thinking. It isn’t as if each moral belief we have is beyond scrutiny. Far from it. Some of our moral views, perhaps even our most cherished ones, may have to go, once we see that they conflict with beliefs that are even better justified. Still, the data of ethical thought, as Ross puts it, are those moral beliefs that have survived very careful reflection. Self-evident principles are where our moral thinking must begin. They are what moral theories must account for. These basic beliefs are to be given up only if we can show that they can’t all be true.

To the extent that a moral theory cannot make room for such beliefs, it is the theory that must go. This was Ross’s diagnosis of both consequentialism and Kantianism, for instance. They both understood morality too narrowly, as limited to a single fundamental moral rule. He thought that careful reflection would show us that there are at least seven such rules—none of them absolute.

Ross realized that his view offered little comfort to those who did not agree with his seven principles. But he was unapologetic. To someone who thought about justice, for instance, and failed to see its moral importance, Ross could do only one thing. He would invite that person to think more carefully about what justice really is. This can be done in many ways. We can offer the person examples to consider; draw analogies to cases that reveal the importance of justice; distinguish justice from other, possibly related, notions; ensure that particular beliefs opposing the importance of justice are not based on error. But suppose the person remains unconvinced even after all of this further reflection. According to Ross, moral discussion now comes to an end, and the only verdict to render is that this person is mistaken. Nothing you can say will show him that he is wrong.

That may strike you as closed-minded, but two things can be said in Ross’s defense. First, what are the alternatives? Why must it always be possible to offer something more in support of one’s beliefs? If justification ever does stop somewhere, in ethics as in other areas, then once we have reached that stopping point, all that could possibly be done is to invite the doubters to reconsider. If, instead, justification is never-ending, then we are back to an infinite regress, which justifies nothing at all.

Second, we should consider the possibility, in nonmoral contexts, of finding ourselves without any support for a claim that we rightly continue to believe. For instance, there may be nothing you can say that will convince a member of the Flat Earth Society of his mistake; no way to convince someone who believes in vampires that he is wrong; no clear path to show a stubborn person that nothing really can be all pink and all blue at the same time. You may be justified in your beliefs even if you can’t always convince those who disagree with you. That holds for moral as well as for nonmoral beliefs.

**Knowing the Right Thing to Do**

Even if our prima facie duties are self-evident, we are still faced with the problem of knowing what to do when they conflict. And Ross has very little
to say here, except that we can never be certain that the balance we strike is the correct one. Ross acknowledged that our actual, all-things-considered moral duty on any given occasion is not something that is self-evident. We may feel very strongly about certain cases; indeed, most moral situations are easy and straightforward, ones we never give a second thought to. Still, there is no definite method for guiding us from an understanding of the prima facie duties to a correct moral verdict in any given case.

We must start our moral thinking about specific situations by understanding the kinds of things that can be morally important. This is a matter of clearly grasping the prima facie duties. These tell us what to look out for. Has a promise been made? A wrong been done? Is there an opportunity for self-improvement here? And so on. But once you answer such questions, you’re on your own. You must bring your experience and insight to bear on the details of a given case. The bad news is that there is no fixed or mechanical procedure that tells us how to do this.

This can be very dissatisfying. There are several aims of moral theory, and one of them, surely, is to offer advice on deciding how to live. Ross denies that there is any general rule to follow in order to provide answers here. What a letdown.

But again, there are a few things we might say in order to make this a bit easier to swallow. First, the idea of a comprehensive moral decision procedure, one that can be consulted to provide definite answers to all moral questions, may not be so plausible. When faced with puzzling ethical questions, we may want a concrete set of guidelines to help us along. But do we really believe that there is such a thing? Each of the familiar options (e.g., the principle of utility, the golden rule, the What if everyone did that? test) has its problems. Perhaps the best explanation of this is that we are looking for something that does not exist.

Second, Ross’s theory is not the only ethical view that abandons the idea of a moral decision procedure. The theories that we next consider—both virtue ethics and feminist ethics—also deny that there is any surefire method for discovering moral truth. And as we’ve seen, even consequentialism can fail to supply a procedure for determining our moral duty. If more than one thing is intrinsically valuable, then it will be unclear what to do when we can maximize one value without maximizing the other.

Finally, the absence of a decision procedure for arriving at conclusions is actually the default situation across all areas of thinking (except mathematics and its associated disciplines). For instance, scientists faced with a conflict between their data and some favored theory have no uniform method for determining whether to modify the theory or rethink their data. Further, even when the data are uncontroversial, selecting the best theory to account for it is anything but a rote, mechanical undertaking. Scientists must rely on good sense, too, since choosing which theory to believe is a matter of balancing the virtues of the competing theories.

There is no precise rule to tell a scientist how to do this.

There are many theoretical virtues: parsimony (employing fewer assumptions than competing theories); conservatism (preserving as much as possible of what we already believe); generality (explaining the broadest range of things); testability (being open to experimental challenge and confirmation); and others. Suppose that one theory is more parsimonious and also more conservative, but another theory is more general and more testable. Or suppose that one theory is far more conservative than any competitor, but is also somewhat less general, and a fair bit less parsimonious. Science does not offer us a definite procedure for identifying the better theory. Sometimes it is just obvious that one theory is better or worse than another. But in close cases, scientists have no alternative but to use their judgment.

And that is precisely our situation when it comes to morality. There are many easy cases where the moral verdict is just obvious. These rarely get our attention, since they don’t call for any hard thinking. It’s the difficult cases—where different options each respect some prima facie duties, but violate others—that require judgment. We can never be sure that we’ve exercised good judgment. We may be unable to convince ourselves, much less our opponents, that we have landed on the right answer to a hard ethical question. The lack of guidance we get from Ross’s view of ethics can leave us feeling insecure and unsettled. That is regrettable. But it may also be inescapable.

Ethical Particularism

The ethic of prima facie duties offers a serious challenge to both absolutism and to monism. Yet there is a view, known as ethical particularism, that is an even more extreme challenge. Particularists reject absolutism. They reject monism. They also deny the existence of any prima facie duties.

Recall that a central feature of such duties is that they represent moral reasons that are always important. Every time you do wrong, for instance,
there is excellent reason to repair the damage. There is, without exception, something to be said for keeping the promises you've made. True prima facie duties point to features that are always morally important.

Particularists deny that anything meets this description. As they see it, something's moral importance depends entirely on context. If they are right, then sometimes there is nothing good at all about keeping a promise, or benefiting someone else, or preventing harm to others. The moral value of such things depends entirely on the details of the case. We have to consider all of the features in a given situation before we can know the moral contribution that any one of them makes.

Prima facie moral rules claim that certain features (e.g., promise keeping, self-improvement, preventing harm) are always morally important. Absolute moral rules state that certain features are not only always morally important, but also morally decisive—these features settle the matter of our moral duty once and for all. Particularism, then, is the view that there are no prima facie or absolute moral rules.

That sounds pretty drastic. Certainly, particularism occupies one end of the spectrum of moral theories, with monistic, absolutist theories (such as ethical egoism or act utilitarianism) at the other. If particularists are right, then morality is entirely particular to specific situations; there are no moral rules at all to help us navigate our way in the world.

Consider an example of particularist thinking: it is often important to keep our promises, but not always, and so Ross was mistaken to think that promise keeping is a prima facie duty. A promise made by a hostage to her kidnapper carries no weight. Nor is there anything good about returning a promised weapon to its now obviously homicidal owner. If particularists are right, there is sometimes no reason at all to keep a promise.

Particularists think that every prima facie rule is subject to this sort of criticism. For each of Ross's prima facie duties, and for any others, particularists will try to offer counterexamples to the rule. A prima facie rule says that X (self-improvement, doing justice, etc.) is always morally important; particularists will try to come up with cases in which X has no moral value at all. If they are right, nothing possesses any fixed moral importance. Whether something has moral value always depends on the other features in a situation.

Particularists often use nonmoral examples to soften us up to their core idea. The intense coloring of a Turner painting is an essential part of what makes it so beautiful. But such colors would ruin a piece by Whistler. The paint drips that make Jackson Pollock's work so interesting would completely spoil a Monet. The lesson here is that whether something makes a difference to the beauty of an object depends entirely on context. There are no rules of beauty, because there are no features that always enhance (or spoil) the beauty of an object.

That a person told me something is sometimes a reason to believe it. And sometimes not (if we are playing a bluffing game, for instance). That an act is against the law is usually a reason not to do it. But not always (think of cases of justified civil disobedience). That I want something is often a reason for me to do it. And sometimes it isn't (consider an addict's desires). Here we have cases in which things sometimes but not always count as a reason. When this is so, the features in question have no place in either a prima facie or an absolute rule.

Particularists rely on such examples to show us that theirs is the ordinary view when it comes to nonmoral matters. And yet when applied to morality, it has met with great resistance from philosophers. There are three primary sources of opposition.

Three Problems for Ethical Particularism

Its Lack of Unity

This criticism, and the next, should be familiar from our discussion of prima facie duties. Monists attacked Ross's theory because, in the words of one critic, it offered us nothing more than "an unconnected heap of duties." Monists felt uncomfortable with the idea of several fundamental moral rules, rather than just one. Indeed, as we have seen, philosophers are strongly tempted to look for a certain sort of moral theory—a body of unified, systematically interconnected claims that stem from a single fundamental truth. Ross's theory was a disappointment in this respect; particularism completely dashes such hopes. On the particularist picture, the moral realm is hugely complex, and there are no moral rules at all to help guide us on our way.

But this cannot be a decisive criticism of particularism. We might hope for simplicity and elegance, but the moral realm may be much messier than we had thought. We can't assume from the outset that monism is true, and then criticize particularism for failing to embrace a single supreme moral rule. Whether the moral realm is neatly ordered, as monists believe; whether it is somewhat structured, as Ross argued; or whether it is highly disordered, as particularists insist, is a matter that can be settled only after a great deal of further moral debate.
Accounting for Moral Knowledge

The second criticism leveled against particularists is that their view provides us with no guidance for gaining moral knowledge. Ross's theory, as we know, came in for criticism on this front, since he failed to offer general advice about how to balance prima facie duties when they conflict. But particularism takes this worry to a new level, since Ross, at least, was able to instruct us on what to look out for in all of the cases we might face. The prima facie rules cannot by themselves settle what is actually right and wrong, but they serve as useful signposts to indicate the features that are relevant in discovering our moral duty.

By contrast, particularists tell us that anything that has once been a force for good may, at other times, be either morally neutral or positively bad. There is no way to know in advance how things are going to play out. Nor is there any method to follow that can clue you in to the correct moral verdict in a given situation. We don't have any rules to tell us what is morally important. And we lack rules to tell us how to figure out our moral duty in specific cases.

If the moral importance of everything depends on context, then there is no general roadmap to follow for those who want to know their moral duty. Indeed, particularists can offer almost no guidance at all, other than some very broad tips (take careful note of details, don't confuse self-interest with morality, get the facts straight, etc.). Basically, they must insist that our moral knowledge comes only through a comprehensive appreciation of all of the relevant features of a situation. Just as we can take in the beauty of a canvas only by noticing how each distinct feature plays off the others, so too we can detect the morality of an action only by taking careful note of all of its important features and their interplay with one another. The features that are relevant in any given situation cannot be known in advance, since no features possess permanent moral importance.

In many ways, this picture is disappointing, since it fails to supply a general blueprint for gaining moral wisdom. Yet this is a serious failing only if there is such a blueprint. There may be. But that remains to be seen.

Some Things Possess Permanent Moral Importance

We can best appreciate the deepest criticism of particularism by considering the central argument in its favor. Call this the Particularist Argument:

1. If nothing possesses permanent moral importance, then there are no prima facie or absolute moral rules.
2. Nothing possesses permanent moral importance.
3. Therefore there are no prima facie or absolute moral rules.
4. If there are no prima facie or absolute moral rules, then particularism is true.
5. Therefore particularism is true.

This argument has only three premises, and two of them—1 and 4—are uncontroversial. So if you have doubts about particularism, then you need to focus on that second premise.

And that is just what critics will do. They will insist that the central claim of particularism, given in premise 2—that there are no features that are always morally important—is mistaken. If it is, then there are at least some prima facie moral rules. Whether there are any absolute rules depends, of course, on whether there are any features (e.g., maximizing happiness, being commanded by God) that are morally decisive in every possible context.

To undermine particularism, we would have to provide examples of features that are always morally important. Perhaps Ross managed to do this—even if promise keeping, for instance, fails to make the cut, perhaps other of his prima facie duties fare better.

Consider doing justice. Relying on the “regret test” mentioned earlier (see p. 236), it seems that there is always some reason for regret when we commit injustice, even if injustice really is the way to go in a given case. But I don't want to rest anything on my view of this matter. That's because we can leave justice aside and still show that particularism is in trouble. There seem to be a number of prima facie duties, even if they are not the ones that Ross himself favored.

For instance, I think that there is always an excellent reason against humiliating people, hurting others strictly for the pleasure it gives you, intentionally killing an innocent person who wants to live, betraying a friend's trust, knowingly violating an oath because of greed, and committing rape. Maybe none of these represents an absolute rule; perhaps, in unusual circumstances, it can be morally acceptable to commit each of these acts. But there would always be something to regret in doing so, and that is good evidence that there is a prima facie duty not to do such things.

This list is certainly not complete. But if my list (or a better one that you can construct) is plausible, then particularism is mistaken. Morality
would have more order and structure than particularists allow. They claim that we can never know in advance, independently of context, whether something is morally important. If there are any prima facie moral rules, that claim is false.

Conclusion

The ethic of prima facie duties has a lot of things going for it. It is pluralistic, and so rejects the idea that the whole of morality can ultimately be explained by a single moral rule. It rejects absolutism, and so explains why it is sometimes permitted to break legitimate moral rules. It easily handles moral conflict without falling into contradictions. It offers an interesting role for regret in thinking about what is morally important. And it nicely handles some of the most difficult arguments designed to undermine moral absolutism.

Yet like all of the moral theories we have discussed, Ross's view is not without its problems. Perhaps the hardest of these concerns the question of how we can know what to do in particular situations. Since there is no permanent ranking of the prima facie rules, and no precise method for knowing how to strike a balance when the prima facie rules conflict, this leaves us with very little guidance for discovering what morality actually requires of us.

Ross also has the worry of explaining how we might gain knowledge of his prima facie rules. I think that the question of how we can know the fundamental rules of morality is very, very hard. And Rossians can take some comfort in the knowledge that every moral thinker shares this problem. I sketched two general strategies (plus one skeptical response) that might be of some help here. But this of course offers only the very beginning of the needed discussion.

As we have seen, those who resist both absolutism and monism need not go in for prima facie duties. They may embrace ethical particularism, which denies that there are any moral rules at all. On this view, nothing is always morally important, much less always morally decisive. Particularism is a bold thesis. But despite its boldness, it does seem that there are some things that are permanently morally important. And if that is so, then there are some prima facie rules after all.

The particularist can still level a challenge to those who think that morality is rule-based. Imagine that after a great deal of thought, we were able to identify a dozen prima facie duties. It might still be the case that

most of the morally important features we encounter in our lives were not mentioned in any of those rules, because these features are only sometimes, and not always, morally important.

For instance, suppose that my earlier remarks about promise keeping were on target, and that there really are cases in which nothing at all favors our keeping a promise. Still, the fact that we promised to do something usually is morally important, even though (on the present assumption) there is no absolute or prima facie moral rule that tells us so. Likewise for telling the truth—there is ordinarily a strong reason to be truthful, even if there are some cases where there is no moral value at all in telling the truth.

If morality is really like this, where many features that are morally important are not always so, then we have a kind of hybrid view, a mix of Ross's theory and particularism. Some types of action possess permanent moral importance, as Ross said. Others do not. If that were so, then we would be faced with a moral world that was far less simple and unified than the one presented by monists and absolutists. Is that our world? That is for you to decide.

Discussion Questions

1. What exactly is a prima facie duty? How does an ethic of prima facie duties differ from monistic and absolutist ethical theories?
2. Does the phenomenon of regret lend any support to Ross's theory? Why or why not?
3. To what extent does Ross's theory provide us with a method for deciding what the right thing to do is in particular situations? Is this a strength or a weakness of the theory?
4. What are the three traditional strategies for dealing with the problem of how we can know what the fundamental moral rules are? Which do you find most attractive and why?
5. How does ethical particularism differ from Ross's ethic of prima facie duties? Can you think of any counterexamples to the particularist's central claim?
What sort of person should I be? An answer to that question provides some of the most vital information you can ever have. And yet none of the ethical theories we have examined thus far does much to address it. Each will say: You ought to be the sort of person who . . . maximizes happiness, or treats others with respect, or adheres to rules that free and equal people would endorse, or honors absolute rules. That's a pretty thin sort of answer.

To see what might be missing, consider what we might say of a police officer who obeys the law, but only reluctantly. He always does the minimum required of him. If he could get away with it, he would extort money from business owners on his beat, brutalize prisoners, and doctor evidence. He doesn't actually do any of these things. But that's only because he's afraid of what would happen if he were caught.

If we focus just on what this man has or hasn't done, we will be missing a large part of the ethical picture. To fill things out, we must consider the kind of character he has. It's not a good one. We don't admire such a person; we don't want our children growing up like him. He is lazy, abusive, and untrustworthy, even if his conduct is satisfactory. If we think only about whether he has done his duty, there is nothing to criticize him for. But that just shows that we need to broaden our thinking. We should focus less on matters of moral duty, and concentrate much more on ideals of character. Following that advice leads us directly to a consideration of virtue ethics.

All of the moral theories we have reviewed thus far share a common assumption: that the moral philosopher's primary task is to define the nature of our moral duty. On this view, What should I do? is the crucial moral question. Once we have an answer to that, I can know what sort of person I should be—namely, the sort who will do my duty as reliably as possible.

But what if we approached ethics from a different starting point? What if we began by considering what makes for a desirable human life, examining the conditions and the character traits needed to flourish? Rather than begin with a theory of moral duty, we would start with a picture of the good life and the good person, and define our duty by reference to these ideals. That is precisely what virtue ethics recommends.

Virtue ethics is not some single theory, but rather a family of theories that can trace its history (in the West) to the philosophy of the ancient Greeks. Aristotle's Nicomachean Ethics, written about 2400 years ago, has had the greatest influence in this tradition, and remains a primary inspiration for most who work in it. Aristotle's book develops most of the major themes that even today define the virtue ethical approach to the moral life. Let's consider some of the most important of these themes.

The Standard of Right Action

Virtue ethics insists that we understand right action by reference to what a virtuous person would characteristically do. To put it a bit more formally,

(VE) An act is morally right just because it is one that a virtuous person, acting in character, would do in that situation.

According to virtue ethicists, actions aren't right because of their results, or because they follow from some hard-and-fast rule. Rather, they are right because they would be done by someone of true virtue. This person is a moral exemplar—someone who sets a fine example and serves as a role model for the rest of us. The ideal of the wholly virtuous person provides the goal that we ought to aim for, even if, in reality, each of us will fall short of it in one way or another.

Virtue ethics is actually a form of ethical pluralism. Though there is a single ultimate standard—do what the virtuous person would do—there are many cases where this advice is too general to be of use. At such times we need a set of more specific moral rules. Virtue ethics can provide these, too. For each virtue, there is a rule that tells us to act accordingly; for each vice, a rule that tells us to avoid it. So we will have a large set of moral rules—do what is honest; act loyally; display courage; deal justly with others; show
wisdom; be temperate; avoid gluttony; refrain from infidelity; don't be timid, lazy, stingy, or careless; free yourself of prejudice, and so on.

When these rules conflict, how do we know what to do? We should follow the lead of the virtuous person. True, there will inevitably be disagreement about who counts as virtuous, and about the actions such a person would pursue. But this needn't cripple us. There is lots of room for critical discussion about who is virtuous and why. In the end, we may have to agree to disagree, since there may be no way to convince someone whose moral outlook is fundamentally opposed to our own. Those who have been raised to idolize Hitler or Stalin are going to have a skewed moral vision, and there may be no way to convince them of their error. Virtue ethicists deny that this undermines the existence of correct moral standards. It just shows that some people may always be blind to them.

**Moral Complexity**

Many moral philosophers have hoped to identify a simple rule, or a precise method, that could tell us exactly what our moral duty is in each situation. What's more, this rule or method could be reliably used by anyone, so long as he or she is minimally intelligent. A classic example of this is the golden rule. Even a five-year-old can apply this test.

Virtue ethicists reject the idea that there is any simple formula for determining how to act. At the beginning of the *Nicomachean Ethics*, Aristotle cautions that we must not expect the same degree of precision in all areas of study, and implies that morality lacks rules and methods of thinking that are as precise as those, say, in mathematics. When it comes to morality, we must be content with general principles that allow for exceptions.

Virtue ethicists have followed Aristotle in this thought. To them, ethics is a complex, messy area of decision making, one that requires emotional maturity and sound judgment. One of the problems of the golden rule, for instance, is that even a child can use it with authority. Aristotle thought it obvious that even the most perceptive children are far short of true moral wisdom.

Virtue ethicists sometimes invite us to appreciate the complexity of morality by having us imagine a moral rule book. The book would contain all the true rules of ethics, and all of the precise methods for applying them. It would state when exceptions were called for and when they were forbidden. It could be applied in a mechanical way, without any need of judgment.

Is this a real possibility? Not likely, according to virtue ethicists. Morality is not like geometry or civil engineering. We have moral rules of thumb that can help us in most situations. But strict obedience to such rules is bound to lead us into error. And the rules, of course, will sometimes conflict. What we need in all cases is a kind of sensitivity. It is something very different from a rote application of preset rules.

This does not mean that everything is up for grabs in ethics. The precision of a discipline is one thing; whether its principles, methods, and results are merely a matter of opinion—each one as good as the rest—is quite another. Morality may be an imprecise discipline, but that does not mean that each person's moral views are as plausible as another's. Aristotle and most of his followers believe in objective standards of morality (those that are true independently of personal feelings or opinions). Whether they are right about this is something that we consider at great length in the final part of this book.

**Moral Understanding**

As virtue ethicists see things, moral understanding is not just a matter of knowing a bunch of moral facts. If it were, then a child prodigy might be one of the morally wisest among us. As we have seen, virtue ethicists deny this possibility. Imagine turning to such a child for advice about dealing with difficult coworkers, or helping a drug-addicted friend through recovery, or determining the best way to break off a relationship.

Moral understanding is a species of practical wisdom. Think of some familiar kinds of practical wisdom—knowing how to fix a car engine, how to skillfully play an instrument, or how to inspire teammates to come together behind an important project. Such knowledge does require an understanding of certain facts. But it is much more than that. We all know people with plenty of book smarts and very little in the way of good sense. Moral wisdom is a kind of know-how that requires a lot of training and experience. What it doesn't require is a superior IQ or a vast reading list.

We need experience, emotional maturity, and a great deal of reflection and training in order to acquire moral wisdom. We have to know how to...
read people, to be familiar with the sorts of troubles people can fall into, to understand the kinds of personality issues that can prevent us from flourishing, to have a keen ability to pick up on social cues. We can’t learn such things only from books.

One way to reinforce this idea is to appreciate the crucial roles that emotions play in moral understanding. There are three that are especially important.

1. Emotions can help us to see what is morally relevant, by tipping us off to what matters in a given situation. Fear can signal danger; guilt can reveal our moral faults; compassion can tell us that someone needs our help. It’s no use knowing that you ought to aid those in need if you always walk around with blinders on, never aware of the struggles or potential discomfort of others. The person with the virtues of compassion, sympathy, and kindness will see things that others miss. Our emotions, when they are well trained, reliably alert us to the morally important features of our lives.

2. Emotions can also help to tell us what is right and wrong. If we are virtuous, the anxiety we feel when considering certain actions is excellent evidence that these actions are immoral. We often feel that certain paths are simply off limits, or that other things definitely must be done, before we have a good intellectual account of why this is so. That a good man feels proud of his actions is reason to think that he has done well. His anger is a reliable indicator that someone has done wrong.

3. Emotions also help to motivate us to do the right thing. They support and reinforce our thoughts about what we ought to do. Knowing the right course of action is one thing; following through is another. The morally wise person will have an easier time of things here, because her emotions will be in harmony with her understanding of what morality calls for. Unlike a weak-willed person or someone who manages to control her inappropriate impulses, the morally wise person wholeheartedly does what is right. She is relatively free of inner conflict and takes pleasure in doing the right thing.

Moral wisdom is an extremely complicated kind of skill. It does require knowledge of the way the world works, but it demands more than that. We must have a great deal of emotional intelligence as well. The moral virtues, which all require moral wisdom, therefore also require a combination of intellectual and emotional maturity. A person with only a crude appreciation for life’s complexities, or a blank emotional life, is bound to be morally blind. Virtue ethics perfectly explains why that is so.

Moral Education

Virtue ethicists, again following Aristotle, believe that moral understanding can be gained only through training, experience, and practice. True, some people are by nature kinder or more generous than others. Yet an impulse in these directions is not enough. Without wisdom, these traits will only occasionally lead to appropriate action. We shouldn’t always give to others or tend to their needs. They may be engaged in evil projects. They may need tough love, rather than indulgence. The wise person will know when to give, and when to withhold.

So virtue is not inborn. It takes time to acquire. And it also takes the right sort of environment and teachers. Indeed, Aristotle thought that whether we are virtuous or not is partly a matter of moral luck. Our upbringing plays a crucial role in whether we are able to become virtuous, and we obviously cannot control the environment we are raised in. If we are lucky, we will have wise and caring parents and teachers to guide us on the path of virtue. But many are not so fortunate. Those who grow up in a corrupt society with terrible role models may (through no fault of their own) lack the opportunity to develop virtues. The most important elements of moral education occur in our youth—so much so that Aristotle doubted that a person raised in vice could later change his character very significantly.

The point of giving children a moral education is straightforward—to help them acquire the virtues. The key to this is to develop their capacity for moral wisdom. The virtue ethicist invites us to think of children as apprentices being taught to gain a very complex skill, that of moral wisdom.

Think first about how apprentices in other areas are trained. An apprentice in a professional kitchen begins with a list of dos and don’ts, a set of hard-and-fast rules. Over time, she learns the limits of these rules, when to honor and when to break them. There is no master rule book that can give her this knowledge. She acquires it through trial and error, through the advice of experts, through a deeper understanding of cooking methods and of her ingredients. By the end of a successful education, she is something of an artist.

The same holds true of moral education. We begin as apprentices, following in an unquestioning way the rules handed down by our parents.

and teachers. In the early stages of their moral training, children learn simple rules, and are told to treat them as absolute: never, ever lie, steal, hit others, tattle, and so on. These rules are crude, but it's right to ask our children to obey them. We address our learners where they are.

As children mature, they will, through experience and guidance, come to appreciate when exceptions are called for. We gradually step back from the rules we learned on our mother's knee, and subject them to careful scrutiny. A successful education will produce an independent thinker, one who doesn't need the old, oversimple rules as a crutch to get through each new situation. We understand, for instance, that honesty is the best policy. But sometimes honesty would be so hurtful and gain so little that evasion is the right way to go. As a rule, friends deserve our loyalty. But that doesn't mean that we must cover up for them if they steal from their employer and ask us to lie about it.

This line of thought supports the virtue ethicist's rejection of a simple moral litmus test, a formula that could be used by anyone, no matter her degree of moral sophistication. Such a test not only overlooks the great complexity of morality, but also ignores the point that people possess moral wisdom in degrees. Advice that is suitable for a novice will be too crude for an expert, and vice versa.

The Nature of Virtue

The ultimate goal of a moral education is make ourselves better people. A better person is a more virtuous person—one who is more courageous, just, temperate, and wise (among other things).

A virtue is a character trait. It's not a mere habit, or a tendency to act in certain ways. Habits don't define a person; character traits do. Some people are habitually loyal or generous. Yet they may lack virtue, because they don't really understand why it is appropriate to act this way. Virtues require wisdom about what is important, and why. While habits are defined as certain patterns of behavior, virtues require much more. In addition to routinely acting well, the virtuous person also has a distinctive set of perceptions, thoughts, and motives.

Let's make this concrete. Consider first the virtue of generosity. A generous person will often have different perceptions from a stingy person. Generous people will see the homeless person on the street, will take note of the shy child in the classroom, will realize that an injured person is having trouble with the door. Stingy people tend to look the other way.

A generous person has different thoughts from those of an ungenerous person. A generous person will think about how to be helpful, will not think only of his own needs, will value being of service and will believe in the goodness of caring for the less fortunate.

A generous person's motives will differ from those of a stingy person. Generous people are not begrudging of their time, they are moved by the distress of others, and they take pleasure in freely giving what they can to those in need.

We can offer similar accounts of all of the other virtues. Courage, for instance, requires that we correctly perceive various threats or dangers, control our fear in a reasonable way, be moved by a noble end, and act accordingly. Though Aristotle considered courage primarily in the context of the battlefield, this virtue, like all virtues, has its place in any number of more ordinary situations. The new kid in school displays courage when taking an unpopular stand among those whose approval and companionship he hopes for. Gandhi displayed courage in peacefully resisting the nightsticks and attack dogs of the British colonial police. A whistle-blower is courageous in revealing the corruption of her employers, knowing that she may be fired or sued for telling the truth.

Virtuous people are therefore defined not just by their deeds, but also by their inner life. They see, believe, and feel things differently from vicious people. They see what's important, know what is right and why it is right, and want to do things because they are right.

People are virtuous only when their understanding and their emotions are well integrated. A virtuous person who understands the right thing to do will also be strongly motivated to do it, without regret or reluctance, for all the right reasons. In Aristotle's view, and in the virtue ethical tradition, this is what distinguishes the truly virtuous from the merely continent—those who can keep it together, manage to do the right thing, but with little or no pleasure, and only by suppressing very strong contrary desires. As Aristotle insists, "Virtuous conduct gives pleasure to the lover of virtue." This is one way to distinguish the truly virtuous from the merely continent.

Virtue and the Good Life

Aristotle thought it obvious that all of us seek eudaimonia, which translates as "happiness," or "flourishing." A life of eudaimonia is an excellent

---

life for the person living it. The happiness Aristotle speaks of is not mere enjoyment. It isn't only a state of mind, but rather a combination of activity and pleasure. Aristotle thought that the good life is an active one filled with wise choices and worthy pursuits. No matter how much pleasure you get from sitting in front of the TV and watching *The Simpsons* (a lot, in my case), a life devoted to that fails to qualify as a good life. Aristotle was no hedonist.

Aristotle argued that virtue is an essential element in a good life. In this he agreed with his teacher, Plato. Unlike Plato, however, Aristotle did not think that we could be happy on the rack. Virtue does not guarantee a good life; it is necessary, but not sufficient, for our flourishing. Most contemporary virtue ethicists side with Aristotle on this one—enough misfortune can damage a life so greatly as to make it, on the whole, an unenviable one. If a virtuous person loses her beloved family to war or disease, or falls prey to nasty rumors, crushing debt, and crippling disability, then no matter how virtuous, she can fail to gain true happiness.

But is virtue really essential to a good life? What about all of those criminals who get away with their crimes and enjoy a lavish retirement? What of the powerful tyrant who dies at the end of a long reign, peacefully and in his sleep? Few would argue that such people are virtuous. Yet they seem to live very good lives.

Virtue ethicists argue that appearances here are deceiving. Such people may indeed be pleased with how things are going, and get a lot of enjoyment from their lives. (Then again, a closer look at the criminal's fear and insecurity, his emotional immaturity and the complications this brings, may make us think twice.) But virtue ethicists deny that pleasure is the be-all and end-all of a good life. Pleasure without virtue is not worth much. The most pleasant life may be a poor one indeed.

How can such a view be defended? Aristotle set up a three-part test to determine our ultimate good, in part to show that pleasure, wealth, power, and fame are not what life is all about.

First off, our ultimate good must not be something that is only instrumentally valuable. This explains why money and fame are ruled out, since these things have no worth of their own. They are merely a means to gaining other things of value.

4. For more on this topic, see chapter 8, pp. 105–07, and chapter 14, pp. 201–05, as well as the general discussion in part 1.

Our ultimate good must also be *self-sufficient*. Possessing it is, all by itself, enough to make a life a worthy one. Political power fails this test. Having power over others is not what makes life valuable. Power is important, when it is, just because of what it enables a leader to do.

Finally, our ultimate good must involve something that is *distinctive* about us, something that is uniquely human. We need food to survive. But being nourished cannot be our final good, since we share this need with plants and animals. And since animals can experience pleasure, the point of our lives cannot be to gain pleasure, either.

What sets us apart from everything else in the world is our rationality. Our ultimate good, then, must take the form of exercising our rationality. But there is little good in reasoning poorly. Rather, our ultimate good consists in the excellent use of our reasoning powers. And that is precisely what the virtues involve.

How attractive is a life of virtue? Very. Just think of what we hope and try for when raising our children. We want them to be kind, fair, generous, appropriately self-confident, and wise. We hope that they develop courage, that they know how to be a good friend, that they can sensitively offer comfort to others in need. Each of these is a virtue; a person who manages to have them all is in most ways living an excellent life. True, if Aristotle is correct, having these traits will not guarantee a good life. The admirable nature of a virtuous person may, for instance, attract the envy and hatred of others, who will sometimes make a martyr of a noble soul. But this should not lead us to think that the virtues are unnecessary for a good life. Even if a life of virtue is not a guarantee that you will flourish, a life without virtue is a poor one.

The virtue ethicist thus has an answer to a skeptic who charges the good person with being a dupe, with sacrificing self-interest on the altar of virtue. Being virtuous will (barring disaster) make you better off. It will ensure that you aim at things worth trying for. Virtuous people ordinarily do very well for themselves, even if the vicious sometimes have more fun. That is because human well-being is *defined* in terms of the virtues. Virtues are those excellences of character that contribute to one's well-being. Without them, one is leading the life of an animal—or worse.

Objections

The virtue ethical approach to life has a number of attractive features. I've tried to sketch some of the more important of them here. But given its unorthodox approach to morality, it is hardly surprising that virtue ethics has come in for its share of criticisms. Here are some of the more significant ones.
Tragic Dilemmas

Consider two central claims of the virtue ethical approach to morality:

1. Actions that would be done by a virtuous agent, acting in character, are morally right.
2. Such actions, when motivated by virtue, deserve our praise.

If these views are problematic, then virtue ethics is in deep trouble. Tragic dilemmas highlight the difficulty here.

A tragic dilemma is a situation in which a good person's life will be ruined, no matter what she does. All of her options will lead to disaster. Virtuous people will usually be able to avoid these situations, since they typically arise as a result of some serious moral mistake. Think, for instance, of the premise of so many movies—simple-minded guy finds bundle of cash, stupidly walks away with it rather than reporting it, and eventually faces a host of deadly choices.

But it is possible to find yourself in a tragic dilemma through no fault of your own. Consider the title character in William Styron's *Sophie's Choice*, who is detained in a concentration camp and then given the terrible news: one of her two children will be sent to the gas chamber. She must choose which one. If she refuses, both children will be killed.

Sophie's life will be ruined no matter what she does. But she should not withdraw from the situation; she must make a choice. A virtuous person (acting in character) would do so, since that would mean saving one of her precious children. If virtue ethics is correct, then selecting one of her children to be murdered is morally right and morally praiseworthy. But that seems wrong.

Here is an Argument from Tragic Dilemmas designed to set out the worry:

1. If virtue ethics is the correct account of morality, then Sophie's selection of one of her children to be murdered is morally right and morally praiseworthy.
2. It is neither.
3. Therefore, virtue ethics is not the correct account of morality.

Premise 1 assumes that a virtuous person would do as Sophie did—namely, select one of her children to die. Further, it assumes that there is a right way and a wrong way to do this. A virtuous person will see the tragedy for what it is, will not leap at the chance to make the selection, will not express joy at what is about to happen. And that was Sophie's response. She was motivated as a virtuous person would be motivated—with a recognition of the terrible burden she faced, with love for her children, and with the greatest possible regret.

The only way to challenge premise 1 is to deny that a virtuous person in Sophie's shoes would select one of her children to be killed. That might be right—a virtuous person might refuse to make a deal with evil, and so try to keep her hands clean by not playing along with the sadistic choice offered to her. But recall that this means the death of both of her children, and it is hard to think that a virtuous person would prefer that to the death of one. I might be wrong about this. If so, then we have a way of rejecting the first premise.

That said, I think that the better option for the virtue ethicist is to criticize premise 2. *Under the circumstances*, a virtuous person *would* try to minimize the number of innocent deaths. And that means having to make a tragic choice, rather than refusing to do so. Choosing is indeed the right thing to do—even if it is absolutely heartbreaking.

It may also be praiseworthy. We might say of a person who refused to make this choice that, however understandable it may be, she was still being squeamish, and showed a lack of nerve. Having to make such a choice under these circumstances requires courage and fortitude, which is praiseworthy. Sometimes life presents us only with a choice among evils. Finding the inner strength to choose the lesser evil on that occasion need not be a moral failing, but may instead be something quite admirable. Our admiration should only increase when the choice involves an outcome that predictably destroys all of one's hopes for happiness.

If this analysis is correct, then virtue ethicists have an adequate reply to the Argument from Tragic Dilemmas. They can argue that certain choices in these situations are virtuous and that such choices are therefore right and admirable, even if, in more ordinary circumstances, any such choice would be purely evil.

**Does Virtue Ethics Offer Adequate Moral Guidance?**

Critics of virtue ethics often accuse it of failing to provide enough help in solving moral puzzles. When we are trying to figure out how to behave, we'd like to have something more than this advice: do what a virtuous person would do.

But virtue ethics can provide more advice. It will tell us to act according to a large number of moral rules, each based on doing what is virtuous or avoiding what is vicious: do what is temperate, loyal, modest, generous, compassionate, courageous, and so on. Avoid acting in a manner that is greedy, deceitful, malicious, unfair, short-tempered, and so on. The list of
still, the virtue ethicist has to face the familiar problem of moral conflict. what happens when these virtue rules conflict with one another? Suppose, for instance, that you are on vacation and happen to see your best friend’s husband intimately cozying up to another woman. would a virtuous person reveal what she has seen? well, there is a virtue of honesty, and that points to telling your friend. But being a busybody and rushing to judgment are vices; it’s their marriage, not yours, and poking your nose into other people’s business isn’t a morally attractive thing to do.

That’s all well and good. But you must do something. how to resolve this conflict (and countless others)? there is a right answer here, because there is something that a virtuous person would do. But virtue ethicists have offered very little instruction for deciding what that is. once you appreciate which virtues and vices are involved in the situation, it is up to you to sort out how to balance them against one another.

This, of course, will be deeply unsatisfying to many people. They want their ethical theory to provide a clear rule that can tell them exactly what is required for each new situation. With expectations set this high, virtue ethics is bound to disappoint.

unsurprisingly, however, virtue ethicists think that such expectations are implausible and far too demanding. They deny that ethics is meant to provide us with a precise rule or mechanical decision procedure that can crank out the right answer for each morally complex case. recall the virtue ethicists’ earlier criticisms of such an idea, and their claim that moral advice must be offered based on a person’s level of wisdom and experience. there is no uniform moral guidebook, no formula or master rule that can tell us how to behave. We must figure it out for ourselves, through reflection, discussion, and experience.

Virtue ethicists can also argue that their theoretical competitors face similar problems. Most ethical theories incorporate a rule requiring promise keeping. But isn’t it sometimes okay to break this rule? if so, is there any other rule that could tell us precisely when we may break our promises? try it out. “you are allowed to break a promise if and only if _______. ” I don’t know how to fill in that blank. That of course doesn’t show that it can’t be done. But anyone who can do it will also be able to know, in difficult situations, how to balance the virtue of fidelity against other considerations.

The bottom line is that almost every moral theory will require us to exercise good judgment in applying its rules. Virtue ethics requires more of us in this regard than some other theories, but that is a drawback only if morality can be made more precise than virtue ethicists believe. whether that is so remains to be seen.

Is Virtue Ethics Too Demanding?
Virtue ethics tells us to do what a virtuous person would do in our situation. But what if a truly virtuous person sets a standard of excellence that is (almost) impossible to reach?

in 1933, Mohandas Gandhi went on a hunger strike that nearly killed him. others have protested injustice by fasting unto death. Some of these protests were not based on personal grievances, but were expressions of outrage at social injustice. Assuming that some hunger strikers are virtuous people, acting in character, it appears that virtue ethics requires us to follow their lead.

Morbidity can sometimes require a great deal of us, but this may be going too far. one possibility, of course, is that it isn’t. Perhaps we should be much readier than we are to give up our health or even our lives in political protest. Virtue ethicists could argue, as consequentialists have long done, that morality really does demand much more of us than we think. They might say that the expectations we’ve been raised with are too lax. if we were raised in a way that repeatedly reminded us of the importance of noble sacrifice, then we would be much more inclined to follow such examples. Our reluctance to sacrifice ourselves is no strike against virtue ethics, but rather against our own self-indulgence and desire for comfort and security.

Virtue ethicists could take a less severe stance, however, and argue that such extreme measures are appropriate only in rather special circumstances. if Russ Shafer-Landau went on a hunger strike, few would pay any attention, and so my extended fast would likely do more harm than good. the test of right action is to ask how a virtuous person, in my circumstances, would act. since my circumstances are quite different from those of a world-renowned political leader, it doesn’t follow that a hunger strike is something i should try myself.

That doesn’t quite let me off the hook. for a truly virtuous person might do much more for others, and far less for himself, than i typically do in my everyday existence. and were he in my shoes, this might still be the case. So virtue ethics may indeed demand quite a lot from us.

5. see chapter 10, pp. 139–41, for more discussion of how demanding consequentialism can be.
Who Are the Moral Role Models?

If virtue ethics is correct, then we can solve moral puzzles only by knowing how a virtuous person would act in our situation. Yet who are the moral exemplars? How do we decide who our role models should be, especially if different people endorse different candidates?

This is a very hard problem. After all, we pick our role models in large part by seeing how well they live up to our preexisting beliefs about what is right and wrong. Some people exalt suicide bombers as role models; others get sick just knowing that's so.

One solution to this problem is relativism—the idea that appropriate role models will differ from person to person, or culture to culture. This leads to the view that moral standards, too, will differ in this way. Since we spend a good deal of time on relativism in chapter 19, I suggest we move on and consider some alternative solutions here.

People can be truly virtuous even if we don't realize that they are. When we fail to choose the right role models, this is often explained by our own failure of virtue. Winston Churchill, for instance, though possessed of a great many virtues himself, was nevertheless so committed to maintaining British rule over India that he never saw past his racist attitudes toward Indians. Churchill once announced, "I hate Indians. They are a beastly people with a beastly religion." His racism prevented him from seeing Gandhi as a moral exemplar; indeed, Churchill was fully prepared to let Gandhi die in one of his hunger strikes. Churchill declared that Gandhi "ought to be lain bound hand and foot at the gates of Delhi and then trampled on by an enormous elephant with the new Viceroy [the British ruler of India] seated on its back."6 Churchill's failure of virtue clouded his judgment so badly that he regarded Gandhi as deserving to die because of his threat to British imperial ambitions.

We become more insightful in selecting moral exemplars only by becoming morally wiser in general. And as we have seen, there is no fixed recipe for doing this. Moral education is a lifelong affair, and we are never fully wise. So we may indeed be off target in selecting our role models.

This isn't the whole story, of course. The whole story would involve a much more detailed account of how we gain moral knowledge, including knowledge of how to correctly identify our role models and how to resolve disputes about this matter. But in this respect, the virtue ethicist is in the same boat as everyone else. Every moral theorist has to answer hard problems about how to gain moral wisdom, and how to resolve disagreements about fundamental moral issues.

Conflict and Contradiction

We have seen in previous chapters how certain kinds of moral conflict can yield contradiction.7 Contradictions are a fatal flaw in any theory. Virtue ethics may be saddled with contradictions, and if that is so, then it is sunk.

The problem is simple. If there are many virtuous people, then what happens if they disagree about what to do in a given situation? If, in my shoes, some good people would act one way, and others would behave differently, then it seems that the same action would be both right (because some role models would do it) and not right (because others would not do it). This is a contradiction.

The very wise people I have known do not all think alike. They don't see every case in the same light. They temper justice with mercy to varying degrees. They disagree about the role and form that discipline should take in good parenting. Some are more optimistic than others; some are more willing to demand more personal sacrifice than others. It thus seems possible that virtuous role models, acting in character, would do different things in the same situation. And that would yield contradiction.

There are a few ways out of this problem.8 The first is to insist that there is really only a single truly virtuous person, and so the differences that cause the contradictions would disappear. The second is to insist that every virtuous person, acting in character, would do exactly the same thing in every situation. I don't find either of these replies very plausible, but perhaps there is more to be said for them than I am imagining.

The better option, I think, is to slightly modify the virtue ethical view of right action, given earlier in this chapter (p. 253) by the thesis labeled (VE). Assuming that virtuous people, acting in character, will sometimes do different things in the same situation, we should say the following:

---

7. See especially chapter 15, pp. 223–24. This matter is also discussed at some length in chapter 19, pp. 296–301.

8. A similar problem confronts the social contract theory; see chapter 14, pp. 208–09.
1. An act in a given situation is morally required just because all virtuous people, acting in character, would perform it.
2. An act in a given situation is morally permitted just because some but not all virtuous people, acting in character, would perform it.
3. An act in a given situation is morally forbidden just because no virtuous person would perform it.

This really will solve the contradiction problem. If different virtuous people would act differently in the same situation, then we are no longer forced to say that an act is both right and wrong. Rather, we say that it is simply permitted, neither required nor forbidden.

A new problem arises, however. If different virtuous people would act differently were they in our shoes, then how are we to decide for ourselves whom to follow? Which of the competing role models should we look to?

This isn't the same problem as the one discussed in the previous section (“Who Are the Moral Role Models?”). There, we were concerned with distinguishing between the virtuous and the not so virtuous, given that there is disagreement over who belongs in each camp. Here, we agree on who counts as a good role model. The problem is that there is more than one, and when they differ in their actions or advice, the theory doesn't tell us whom to follow.

This is another way in which virtue ethics fails to give us all the advice we might hope for from a moral theory. This isn't by any means a knockdown criticism of the theory. But it does point to more work that the virtue ethicist needs to do.

The Priority Problem

How do we get a handle on the nature of virtue? Here is the standard way. We first get clear about our duty, and then define a virtue as a character trait that reliably moves us to do our duty for the right reasons. So, for instance, to understand the virtue of generosity, we first note that we are duty-bound to help the needy, and then define generosity as the character trait of giving to others in need, for the right reasons.

Virtue ethicists reject this strategy, because they deny that we can know our duty before knowing how virtuous people characteristically behave. For them, virtue has a kind of priority over duty—we must know what virtue is, and how the virtuous would behave, before knowing what we must do.

Virtue ethics is unique in this regard. All other moral theories think of duty as the primary moral concept. For them, we can understand virtue only after we have the concept of duty under our belt.

The issue is about which concept is morally fundamental—virtue, or right action. To help see the stakes here, consider this question: are people virtuous because they perform right actions, or are actions right because virtuous people perform them? Other moral theories go with the first option. Virtue ethics takes the second. And this raises a number of concerns.

Consider the evil of rape. The virtue ethicist explains its wrongness by claiming that virtuous people would never rape other people. But that seems backward. It is true, of course, that virtuous people are not rapists. But their rejection of rape is not what explains its wrongness. Rape is wrong because it expresses contempt for the victim, sends a false message of the rapist's superiority, violates the victim's rights, and imposes terrible harm without consent. We explain why virtuous people don't rape others by showing why rape is wrong. We don't explain why rape is wrong by showing that good people will not rape others.

The same goes for right actions. A bystander who sees a toddler about to walk into traffic should rush over to prevent the accident. Why? Not because a virtuous person would do such a thing (though of course she would). The real reason is to save a child's life, or at least to prevent her from being seriously injured. It's not that intervention is right because virtuous people would do it; rather, they would do it because it is right.

If this has a familiar ring to it, that's because the structure of this theory closely mirrors that of Euthyphro's preferred view, the divine command theory (discussed in chapter 5). That theory denied that we could understand our duty apart from the decisions made by God, because God's commands are what create our duty. Virtue ethics takes a similar approach to morality, though many of its versions, including Aristotle's, are secular.

Virtue ethics tells us that it is the actions of virtuous people, rather than God's commands, that determine what is right or wrong. According to virtue ethicists, people aren't virtuous because they do right; actions are right because they are done by the virtuous.

Virtue ethics and the divine command theory share a basic structure. And they share a basic weakness. We can see this by posing a familiar dilemma. Virtuous people either have, or don't have, good reasons for their actions. (1) If they lack good reasons, then their actions are arbitrary, and can't possibly serve as the standard of morality. (2) If they do have good reasons to support their actions, then these reasons, and not the actions themselves, determine what is right and wrong.
The second option is the better one. We must suppose that virtuous people act on good reasons, or else they wouldn't really be virtuous. Consider again the immorality of rape, and the many reasons why it is wrong. A virtuous person is one who is aware of these reasons and takes them to heart. Rape is wrong not because good people oppose it. They oppose it because it is wrong.

This approach preserves the integrity, the wisdom, and the goodness of the virtuous person. But there is naturally a cost. And it is steep. The cost is that the virtue ethicist's account of right action is directly threatened. That account tells us that acts are morally right just because all virtuous people would perform them in the circumstances, and wrong just because such people would refrain. But as we have seen, the choices of virtuous people do not make actions right or wrong.

We can still look to virtuous role models for reliable guidance on how to act. But their choices do not turn otherwise neutral actions into ones that are right (or wrong). They are not so powerful as that. Virtuous people have keen insight into the reasons that make actions moral or immoral. They feel the compelling force of these reasons, and act accordingly. That is what makes them virtuous.

If this line of criticism is on target, then we have an explanation of why so many moral theories give priority to duty over virtue. We need to explain virtue in terms of duty, because we would otherwise be left with a picture of virtuous people that makes their choices arbitrary. But if that is so, then virtue ethics is in trouble, since one of its fundamental points is that rightness is defined in terms of the choices of the virtuous.

Conclusion

Virtue ethics represents an exciting continuation of an ancient tradition. It has a variety of attractions, not least of which is its emphasis on the importance of moral character. It represents a pluralistic approach to morality, and has interesting things to say about ethical complexity, moral education, the importance of moral wisdom, and the nature of the good life. Many of the criticisms that have been leveled at it can be met once we dig a bit deeper, or introduce small changes to the theory.

But no ethical theory, at least in its present state, is immune to all real difficulties, and virtue ethics, too, has its vulnerable points. The greatest of these takes aim at one of its central claims: that right action must be understood by reference to virtue, rather than the other way around. Perhaps virtue can really enjoy this sort of priority. But it will take a great deal of further work to show it so.

Discussion Questions

1. How might a person do the right thing but still fail to be morally admirable? How does virtue ethics account for this?
2. How do we come to know what the right thing to do is in a particular situation, according to virtue ethics? How does this account of moral knowledge differ from the accounts given by previously discussed theories? Which do you find more attractive?
3. Aristotle believed that being a virtuous person was essential to one's life going well. Do you agree? What reasons can be given in support of this position?
4. Virtuous people sometimes disagree with one another about which actions are right. Is this a problem for virtue ethics? Why or why not?
5. What is the priority problem for virtue ethics? Do you think the virtue ethicist has an adequate reply to this problem?
CHAPTER 18

Feminist Ethics

The Elements of Feminist Ethics

The most prominent authors and supporters of the ethical theories that we have considered so far have one thing in common. They are all men. Most of them lived in societies that systematically discriminated against women. Since even the most high-minded thinkers are bound to reflect some of the common assumptions of their times, it should come as no surprise that many important philosophers held views about women that nowadays make us cringe.

Aristotle said that “the male is by nature superior, and the female inferior; the one rules, and the other is ruled.” Aquinas claimed, “As regards her individual nature, each woman is defective and misbegotten.” Kant wrote that “laborious learning or painful pondering, even if a woman should greatly succeed in it, destroy the merits that are proper to her sex . . . [and] they will weaken the charms with which she exercises her great power over the other sex . . . Her philosophy is not to reason, but to sense.” Rousseau said, “Women do wrong to complain of the inequality of man-made laws; this inequality is not of man's making, or at any rate it is not the result of mere prejudice, but of reason . . . [Women] must be trained to bear the yoke from the first, so that they may not feel it, to master their own caprices and to submit themselves to the will of others.”

We might be tempted to downplay these slights by claiming that they did not influence the main lines of argument of these thinkers. And there is a sense in which this is correct—almost none of the major male philosophers of past centuries wrote very much about women. But there is also a sense in which it is incorrect, for there are two ways in which philosophers have shortchanged the lives of women. The first is to make false and damaging claims about them. The second is to ignore female experiences and perspectives. Both have been the norm in ethical thinking for centuries. Feminist ethics seeks to remedy both of these flaws.

Feminist ethics is not a single theory, but rather a general approach to ethics that is defined by four central claims:

1. Women are the moral equals of men; views that justify the subordination of women or downplay their interests are thus mistaken on that account.
2. The experiences of women deserve our respect and are vital to a full and accurate understanding of morality. To the extent that philosophers ignore such experiences, their theories are bound to be incomplete, and likely to be biased and inaccurate.
3. Traits that have traditionally been associated with women—empathy, sympathy, caring, altruism, mercy, compassion—are at least as morally important as traditionally masculine traits, such as competitiveness, independence, demanding one's fair share, a readiness to resort to violence, and the insistence on personal honor.
4. Traditionally feminine ways of moral reasoning, ones that emphasize cooperation, flexibility, openness to competing ideas, and a connectedness to family and friends, are often superior to traditionally masculine ways of reasoning that emphasize impartiality, abstraction, and strict adherence to rules.

Two cautionary notes. First, no one believes that every woman is compassionate and caring, or that every man is aggressive and competitive. These are generalizations that hold only to some extent, and allow for many exceptions. Second, when I speak of traditionally masculine and feminine traits, I mean just that. These are features that our cultures have long associated with men and with women, respectively. But there is no claim that such traits are innate. Many characteristics we associate with

certain groups are a by-product of social influences. Stereotypes often fail to have any basis in fact. But even when they do, these facts are often a result of difficult circumstances and limited opportunities, rather than the expression of some inborn character.

Moral Development

Feminist ethics really came into its own in the 1980s. Before that, scattered writings by feminist philosophers had been appearing for at least two centuries. But in 1982, Harvard psychologist Carol Gilligan published *In a Different Voice*. It's fair to say that this book did more than any other to launch this new movement in philosophical thinking.

Gilligan argued that women think and experience the world differently from men. This was not news—psychologists had long agreed on this point. The difference, though, was that Gilligan rejected the mainstream views that saw women's thinking as inferior to men's.

One of the most influential models of moral thinking in the 1970s was put forth by Lawrence Kohlberg, a teacher and colleague of Gilligan's. Kohlberg defended the idea that there are six stages of moral development. At the earliest stage, as children, we see moral rules only as potential threats, and we behave well only out of fear of punishment. As we grow, we view morality (at Kohlberg's third stage) as depending on our social roles and on our relations. Moral demands come from these roles and relationships; the point of morality is to reinforce them. Ultimately, at the sixth and highest stage, we think of morality as requiring obedience to abstract rules of impartial justice. These rules require us to see our situation dispassionately. They assign everyone equal importance. These rules are universal, and do not depend on, or refer to, the particulars of our character or our situation.

Gilligan noted that many women fare poorly on Kohlberg's scale—they never advance beyond the third stage. She argued that women brought an attitude of care and sympathy to their decision making, an attention to the concrete particulars of the cases with which they were confronted. They rarely appealed to abstract moral principles. They did not regard justice as all-important. They were partial to certain people—family members, friends, lovers—rather than seeking to give everyone the same degree of concern. In deciding what to do, they sought compromise where possible, and did not regard the relevant moral rules as absolute. They tried to "split the difference" in cases of conflict, and showed greater respect for views that differed from their own. They were inclined to voice their views with hesitation and humility, rather than with great confidence and assurance.

Gilligan did not argue that all women thought in these ways. Nor did she claim that women, by nature, were attracted to these ways of thinking. Still, she claimed to have identified a very strong tendency among the women she studied to react to cases of moral conflict in the same way—a way very different from that of the men she interviewed. Gilligan argued that this was not evidence of the moral immaturity of these women. Rather, it indicated the failure of Kohlberg's six-stage model. As she saw it, it was only a prejudice—a very well-entrenched and long-standing one, to be sure—that elevated Kohlberg's emphasis on justice, impartiality and rules over traditionally feminine ways of moral reasoning.

Gilligan is a psychologist, not a moral philosopher. She saw her work as describing the differences between male and female thinking, and did not focus on drawing out the ethical implications of her research. But philosophers soon took up this task, developing a new model of moral thinking that set out to challenge the prevailing ethical wisdom on a number of fronts. Let's turn our attention to some of the most important of these challenges.

Women's Experience

There is always a danger of oversimplifying things when discussing "the female perspective." There is no such thing, strictly speaking. Women's experiences, their outlooks on life and their responses to it, are extraordinarily diverse. On any issue of importance, there are women on opposite sides of the fence—just as there are men. Many men share the outlook that Gilligan associated with women, and many women share a more "masculine" approach to moral thinking.

And yet... even though there is no one thing that is "the female outlook," there are some distinctively female experiences (giving birth and mothering, most obviously), and many others that are widely shared by women, less so by men, and that have been largely neglected by philosophers. One of these is a vulnerability to rape. Another is the threat of domestic abuse. Yet another is the systematic disparity in pay for equal work. Another is women's total or near total exclusion from a variety of professions...
Women are not the only ones who have suffered these threats and limitations. Many men have been raped and beaten, have experienced discrimination of various forms. But the likelihood of such suffering is greatly increased if one is a woman. And yet prior to the early 1980s, philosophers had almost completely ignored these issues, devoting little if any thought to the ethical problems they raised. One goal of feminist philosophers is to put these issues on the map, and to get philosophers and policy makers to devote their time and attention to solving them.

There is another, related aspect of ordinary female experience that bears mentioning here: an increased dependence and diminished autonomy. Compared to men, women have almost always had far fewer choices open to them, and have enjoyed far less control over important aspects of their lives. In many countries, women still need the permission of either their husbands or a close male relative to travel outside of their region. Women have been, and in many places continue to be, unable to choose a spouse for themselves. Women are far likelier than men or boys to be sold into sexual slavery. Many kinds of jobs, all political offices, and a variety of social positions have been closed to women, just because they are women.

These are commonplace observations—no less true and no less worrisome for that. We can summarize them by noting that a central fact of most women’s lives is their dependence, and the frequent demands to place their own interests on the back burner. Married women have traditionally had very little choice about where to live, for instance—if their husband’s job required a family move, then that was that. It is still the case that the mother is usually the one to sacrifice job prospects if a couple decides that one of them must stay home to care for their child. Historically, and still in most areas around the world, women are dependent on men for their economic survival. They are vulnerable to physical abuse by husbands or male relatives. They are legally at the mercy of judicial systems ruled by men.

Dependence on others often requires us to rethink our moral assumptions. Consider this popular one: we should stand up for our rights and defend our honor against attacks. But if a woman has little education and less job training, does she walk out on an abusive husband who is paying the bills? Does she confront him and go so far as to seek a divorce—knowing the terrible statistics of spousal murder, and not knowing where her next meal will come from?

When we rely on others for our income, a roof over our head, or physical security, we are vulnerable to their decisions and constrained in our own. That is the situation that most women and all children face. It is also the situation of many men. To the extent that philosophers hope to address the real-life situations of most people, they must follow the advice of feminist thinkers and pay more attention to the ways in which we are dependent on others.

The choices of most women (and most men, for that matter) reflect their role within a family—as a grown child of elderly parents, as a spouse of someone whose needs and wants will not always match your own, as a sibling whose brothers or sisters may sometimes require your immediate, significant assistance. We do not choose our parents or our siblings. Consent does not enter into it, and yet here we are, with duties to them whether we like it or not. What morality requires of us often depends on who we are related to. And this is usually something that we cannot control.

The importance of vulnerability, of not having control over important aspects of one’s life, of dependence and connectedness to others, are all features of the moral life highlighted by feminist ethics. What we ought to do with our lives, from the big picture to our everyday choices, is often a matter of having to recognize the importance of those we care about. The interests and desires of our partners or spouses must be taken into account. Those of us with children know how needy they can be—even the least needy among them. True friends are sometimes very demanding. Fulfilling our duties across this range of relationships often means setting aside our own interests, or seeing our interests as crucially dependent on the interests of those we care for.

It’s not that women alone are deeply connected in this way. Most of us are enmeshed in a network of personal relationships, many not of our own choosing. Feminists argue that this should force us to rethink the ideal of a person as a free agent, isolated, and wholly independent. Once we really appreciate how connected we are to others, the moral philosophies that are based on ideals of self-interest or full autonomy may become less appealing.

A way of reinforcing this point comes from feminists who emphasize the importance of caring in establishing and sustaining our vital relationships. Women have usually been cast in the role of nurturer—the one who
sensitively cares for others in need. Of course not all women are tender and nurturing. But it is important to understand how much of what goes on in society depends on domestic work being well done—children fed and well raised, house and household well maintained. Society is possible only if there are people devoted to caring for others. Without caretakers, children would die, the sick and the infirm would die, and many of the mentally disabled and mentally ill would die. Most of those whose work does not involve caring for others are able to keep their jobs only because there is someone back at home who is managing the household. That someone is usually a woman. Where it is not a wife or mother, it is usually a domestic employee or servant—and this, too, is almost always a woman. Where standard ethical theories see morality as primarily about the pursuit of self-interest (egoism), doing justice (Kantianism), seeking mutual benefit (contractarianism), or impartial benevolence (utilitarianism), many feminists point to care—especially a mother’s care—as the model of moral relations and the basis of ethics. This maternal model has generated what feminist philosophers now call an ethic of care. Let’s take a closer look at this new moral theory.

The Ethics of Care

The major moral theories we have discussed thus far are not designed with home and family life in mind. But since so many of our most important moments are spent with those we love, and since so many moral choices are made within the context of close relationships, why not imagine what an ethic would look like that took these as its starting points? In particular, many feminist ethicists have argued that we should think of a loving mother’s care for her children as a model for all moral behavior.

We can better understand an ethics of care by first seeing what it is not. Unlike ethical egoism, care ethics does not insist that we always look out for number one. Mothers often rightly sacrifice their own interests in order to advance those of their children. Unlike Kantianism, an ethics of care does not place supreme importance on justice. Matters of justice are not entirely absent from parent-child relations, but they are certainly not the primary focus here. It is important that a parent not try to swindle her children, and that children show respect for their parents. But standing on one’s rights, insisting on a fair share, and ensuring that the guilty are given their just deserts are not at the heart of loving relationships.

Contractarian theories see the authors of the moral law as indifferent to the needs of others, willing to make sacrifices for them only if there is a reasonable chance of being compensated in return. Good parents don’t see things that way. A mother’s care is not conditional on her child’s obedience to a set of mutually beneficial rules. The rational pursuit of self-interest is not the ultimate goal; if the only way to help your child is to take a serious hit yourself, a good parent will often do just that.

And contrary to utilitarian demands for impartial benevolence, loving parents are much more concerned about their own children than about other people’s kids. There is no thought of being impartial here; a good mother will be partial to her children, will give them more care and attention than she does anyone else’s children. Love and care cannot be parcelled out to everyone equally.

In addition to these specific differences, the ethics of care incorporates the following features. Most of these represent a point of departure from most traditional ethical theories, though as we’ll see, there are some points of similarity between the ethics of care and both virtue ethics and Ross’s ethical pluralism.

The Importance of Emotions

Care is an emotion, or a network of reinforcing emotions that involve some combination of sympathy, empathy, sensitivity, and love. Like all emotions, care has elements that involve thinking and feeling. The relevant thoughts are focused on the wants and needs of the one being cared for. The feelings are positive, friendly, helpful, nurturing, and often loving. Care helps us know what others need—parents often understand what their own child needs much better than anyone else. And care helps to motivate us to tend to those needs, even when we are exhausted, begrudging, or angry. How many mothers and fathers have roused themselves from a sound sleep to soothe their crying infant? Care helps ease those parents out from under the covers.

Utilitarians don’t place much importance on the emotions in knowing what’s right and wrong. Calculating amounts of happiness and misery isn’t an emotional task. And we have seen how dismissive Kant was of the emotions, claiming that reason alone could both tell us where our duty lay and get us to do it. Kant was surely right in thinking that our emotions cannot go unchecked—we need an ethic of care, and not just care itself.

6. See the discussion in chapter 12, pp. 174–75.
But feminist philosophers argue that care and its associated emotions are central to moral motivation and moral discovery, even if they are not the whole story.

Those who defend an ethics of care sometimes see themselves as working within a virtue ethics tradition. And this makes sense, given the emphasis not only on what we do, but on how we do it. The manner in which we do things is often as important as what we do.

Suppose, for instance, that my mother calls me up and asks that I spend the afternoon helping my aged father with some household chores. I do as she asks, but only begrudgingly, and make it clear with my body language and my brusqueness that I resent being there. I've done the right thing, but in the wrong manner. I am not acting virtuously, and am not displaying an appropriate level of care.

Against Unification

Most of the traditional ethical theories offer us one supreme moral rule that determines the morality of all actions. Feminist ethics rejects this picture. I can't offer a short formula to describe the feminist conditions of right action, because there is no such formula. Ethics cannot be systematized. If feminists are correct, there is no ultimate rule that can explain or justify all of our moral duties.

This has a number of important implications. One of these is that there is no surefire test for knowing what morality demands of us. Morality is complicated and messy. The drive to try to unify all of morality under a single supreme rule is an understandable one. Such a rule would lend clarity and structure to ethics. But feminists argue that this is a pipe dream.

We can see this as it plays out in the lives of many women (and men) faced with conflicting demands from children, work, spouses, and other sources. Suppose your parents call you up and proceed to criticize your boyfriend. He later asks you what you and your parents talked about. Do you tell him what they've said, knowing that he'll be hurt and that this is going to make a good relationship between him and your parents even harder to achieve? Or suppose your husband believes in disciplining children with a very firm hand. You disagree. He spanks his son—your son—after some minor misbehavior. Then he does it again. What do you do?

These aren't life-or-death cases. Rather, these are ordinary situations that arise in homes all the time. Feminist philosophers say of such examples that while there is often a right thing to do, we can't read off a recommendation from some simple rule. Rather, we have to appreciate the different sources of our moral duties. These stem primarily from relationships we have with other people. And they can conflict with one another. When they do, it can be very hard to know what to do. At such times, we may wish for some easy formula that could give us instant advice about how to behave. But if feminist philosophers are right, there is no such thing. Part of gaining moral maturity is recognizing this, facing life's difficult choices, and not pretending that overly simple answers will solve our problems.

Against Impartiality and Abstraction

There are many reasons that philosophers have been so attracted to the idea of a supreme moral rule. Here is one of them. The more general and abstract the rule, the less likely it is to include bias. A rule that applies only to certain people or to certain situations may reflect only a limited perspective. Philosophers have long sought an outlook that is free of prejudice and distortion, one that takes into account all people at all times.

But why is this so important? The traditional answer is that it gives us a way to ensure impartiality. We must think of everyone as moral equals, and that means giving each person equal weight when we determine what is right and wrong. But as we have seen, feminists reject the idea that we must proceed in this way.

It is right that we give priority to those we care about. It is good to be partial to our loved ones. Feminist ethicists resist the push to abstraction that we see so strongly in philosophy. Moral reasoning should not be centered around a single, very general rule, but rather should be guided by a more complicated understanding of the specifics of situations.

For instance, feminists reject Rawls's attempt to strip away all concrete, particular knowledge of who we are when determining the principles of justice (see p. 195). They reject the utilitarian emphasis on impartiality. They deny that any general rule, such as lex talionis (see pp. 177-79), can illuminate the nature of justice. We must instead substitute a sensitive appreciation of the details and complexities of a situation, and
not try to solve moral problems by seeing how these features fall under some general moral rule. If an ethic of care is correct, there is no master rule that can successfully guide our moral decisions.

**Against Competition**

It shouldn't be surprising that the virtues of competition are so often touted by men. Competition governs the business world, the realm of politics, and the world of sports—for so long exclusively male domains, only recently opened to women. Moral theorists have sometimes borrowed this emphasis on the importance of competition. Ethical egoists require us to harm others if their interests compete with our own. Contractarians think of social interactions as a series of *prisoner's dilemmas* (see pp. 190–92), in which each person's interests are pitted against those of others.

An ethic of care seeks to replace this picture with one that values cooperation over competition. A healthy mother-child relationship is not a competitive one. It does not set the interests of parents against their children. It is marked by kindness and a willingness to sacrifice for one another. Good parents will see their interests as very closely bound up with the interests of their children, rather than in competition with them.

Feminists argue that we should try to turn competitive situations into cooperative ones. Rather than highlight the areas in which our interests clash, we should try to seek reconciliation. We should turn demands into requests, try to understand where the other person is coming from, and be flexible in our dealings with others. We can't show the same degree of care toward others as we do toward our loved ones, but we can approximate this, and look to care as the basis of our relationships. Imagine how different the business, political, or social worlds would be if people were animated by care rather than by self-interest and competitiveness. It's a far cry from the world we live in—and a far better one, if feminists are right.

**Downplaying Rights**

Feminists often argue that moral theories have placed too much emphasis on justice. Demanding our rights, insisting that others honor our claims, and making sure we get what we are entitled to—these are ways of asserting our independence from one another, rather than our connectedness. Talk of rights can divide us more quickly. This is a common complaint about the abortion debates, for instance. Once we start speaking of the rights of a fetus and of a woman, the debate becomes bogged down, making it very difficult to find common ground with those on the other side of the fence.

Imagine that we instead emphasized our responsibilities to one another, based on the model of a caring parent toward her children. Society would be seen not as a venue for the pursuit of rational self-interest, but rather as a stage for cooperation where we took responsibility for one another, and especially for the most vulnerable among us. In the area of social policy, for instance, this would lead to placing much greater importance on education, support for poor families, and on making sure that everyone had access to excellent medical care.

The emphasis on rights has often meant giving priority to our being free from coercion and unwanted interference. Rights protect autonomy and independence. And so we have rights, for instance, to say and to read what we want, or to do what we like within the privacy of our own homes.

But many (though not all) feminists have launched pointed criticisms of such priorities. They argue that rights tend to place us in opposition to others, creating a barrier beyond which no one may pass without permission. Individual rights often allow people to pursue their own paths at the expense of the community. Rights emphasize the ways in which we are separate from one another, rather than the ways in which we might be brought together.

After all, loving parents do not stand on their rights when their child needs them. They do not want to assert their independence from their son or daughter. Feminists argue that rather than finding ways to insulate ourselves from others, we should be looking to create more opportunities for people to help one another. We should emphasize our responsibilities to others, rather than our rights against them. To the extent that rights stand in the way of building community and forging close ties with others, most feminists regard them with suspicion.

**Challenges for Feminist Ethics**

Feminist ethics is an approach to morality, rather than a single unified theory with specific claims that all feminists endorse. As a result, a presentation of this family of views must settle for highlighting general lines of thought, rather than particular arguments and views that all feminists will accept.

Feminist ethicists currently deal with several challenges. And this is unsurprising, given that extensive work in the area is only a generation old. Here are some of the most important of these challenges.
1. The feminist ethics of care threatens to restrict the scope of the moral community too greatly. Indeed, early care ethicists argued that we have moral duties only to those we care about. This view is no longer argued for, as it leaves us without any moral duties to strangers or to those we thoroughly dislike. But if we are to model our moral behavior on the mother-child relation, then we need extensive advice about how this is supposed to work in the case of those we don't know or care about. After all, one way in which we seem to have made moral progress is by extending the scope of the moral community beyond those who are near and dear to us.

2. The role of the emotions in helping us to know the right thing to do, and in moving us to do it, needs further exploration. Moral clarity sometimes requires that we overcome our indifference and become more emotionally invested in an issue. But in other cases, emotions can cloud our judgment. We need a view of which emotions are appropriate, and when they are appropriate, since the very same emotion can sometimes be enlightening and at other times anything but. An emotion such as anger often blinds us to the truth and prevents us from doing right. And so it needs to be regulated. But anger can also correctly alert us to serious immorality, and will sometimes move us to overcome our fear and to do the right thing. We need a much fuller story about the role of the emotions in the moral life.

3. Downgrading impartiality has its costs. As we saw in an earlier chapter (9, pp. 124–25), there is a great deal to be said for the importance of impartiality. It is a definite virtue of judges and others who hold positions of civic responsibility. It is an important corrective for prejudice and bias. It is one of the best reasons for taking the interests of women as seriously as those of men. Impartiality may not always be the right way to go, but it is, at least sometimes and perhaps usually, the best perspective from which to make important moral decisions.

4. Rejecting any supreme moral rule leaves it hard to know how to solve moral conflicts. A virtue of the principle of universalizability, or the principle of utility, is that we have a definitely standard to appeal to in trying to decide how to act in puzzling cases. Without such a standard, we may be left largely in the dark about what morality allows or requires of us.

5. While cooperation is often an excellent thing, we also need to have strategies for dealing with uncooperative people or governments. The world would be a much better place if we were all able to get along and put our differences behind us. But as we all know, good faith and flexibility are sometimes met with a sneer and an iron fist, and we need to plan for such occasions. Caring for our enemies will sometimes mean that they kill us or those we are entrusted to protect. Further, competition is sometimes a good thing. It can enhance efficiency in business. It can make for inspiring athletic events. It can spur us to personal excellence. So we shouldn't give up on competition entirely. And that means developing a sophisticated view of when it is and isn't appropriate to prefer cooperation over competition.

6. While justice and rights are not the whole of morality, they are nonetheless a very important part of it. We can explain what is so immoral about the oppression of women by citing the rights that are violated by sexist actions and policies. Women have rights to be free of physical abuse; they have a moral right to be paid the same amount of money for doing the same work; it is a gross injustice to forcibly circumcise a teenage girl (or a grown woman, for that matter). Rights are a form of moral protection, and women are often the ones in need of the strongest protections. A plausible feminist ethic must therefore make room for the importance of moral rights and the demands of justice that they support.

Conclusion

Feminists have often been described as those who think that women ought to be treated exactly as we treat men. But this is a mistake. Feminists argue not for equal treatment—after all, many of the ways that men typically get treated are morally questionable. Rather, feminists argue for equal consideration. The interests of women are to be given the same importance as those of men. When setting social policies, when evaluating traditions, or when trying to settle conflicts between men and women, it is immoral to downgrade the interests of women just because they are women. Women are the moral equals of men. This simple idea, if taken seriously, would lead to radical change in most areas of the world.

Perhaps Carol Gilligan was right in arguing that women's moral thinking typically differs significantly from that of men. Many neurobiologists and cognitive scientists have since endorsed this basic idea. But even if Gilligan got it wrong (as some have argued—you didn't expect everyone to agree on such a matter, did you?), we can still learn a great deal about ethics by reimagining moral philosophy through the lens of traditionally feminine concerns.

Many of us, men as well as women, are more vulnerable and dependent than traditional moral theory allows. In the real world, there are
severe inequalities of wealth and power, and it pays to be sensitive to such things when deciding on our moral ideals. Making care the centerpiece of our moral life, and allowing emotions and our loving relations a larger role in moral thinking, can make a substantial difference in our ethical outlooks.

Feminist ethics is not just for women. Its recommendations are intended for men and women alike. The importance of care, and emotions generally; the emphasis on cooperation; the attractions of flexibility and compromise; the need for more than justice—each of these is as morally important for men as it is for women.

Feminist ethics is best seen as a general approach to morality, rather than as a well-developed theory that can at this point compete directly with the traditional moral theories. But this is not necessarily a weakness. Rather, it is evidence of the wide variety of views that can be developed by those who take the interests of women just as seriously as we have long taken those of men.

Discussion Questions

1. What distinctively “female” experiences do feminists claim are neglected by traditional ethical theories? Do you agree that moral philosophy should be more attentive to these experiences? If so, how should our ethical theories incorporate them?
2. Most ethical theories stress that impartiality is important to acting ethically. Why do feminist ethicists deny this? Do you think they are correct to do so?
3. Like Ross’s pluralism, feminist ethics rejects the notion of a single supreme principle of morality. What are the advantages of this approach? What are the disadvantages?
4. How is feminist ethics similar to virtue ethics? How do the two approaches differ?
5. Given that feminism is often associated with the idea of women’s rights, it might seem strange that feminist ethics downplays the importance of rights. What are the reasons feminist ethicists give for doing so? Do you find this an attractive feature of the feminist approach to ethics?
Ethical Relativism

Moral Skepticism

Each of us has our doubts about morality. Most of these reflect our occasional puzzlement about what's right and wrong—we aren't sure, for instance, whether it is ever okay to lie, or to break a deathbed promise.

But there is another kind of doubt, one that can undermine all of our confidence in morality. This sort of puzzlement is not about the content of morality—what it requires or allows—but about its status. The worry, specifically, is that moral skepticism—the denial of objective moral standards—is correct, and that morality therefore lacks any real authority.

The notion of objectivity, like so many others that we have seen in these pages, is ambiguous. Objective moral standards are those that apply to everyone, even if people don't believe that they do, even if people are indifferent to them, and even if obeying them fails to satisfy anyone's desires. Moral claims are objectively true whenever they accurately tell us what these objective moral standards are, or what they require of us.

There are millions of objective truths. Here are three, at random. The planet Jupiter has a greater mass than Mercury. John Milton wrote Paradise Lost. Galileo is dead. It doesn't matter what you think of these claims,

---

1. The term moral skepticism sometimes refers to the view that gaining moral knowledge is impossible. (That's the way I used the term in chapter 16, for instance.) I am going to use the term here in a different way, noted above—namely, to refer to all theories that deny the existence of objective moral standards.

2. All terms and phrases that appear in boldface are defined in the Glossary at the end of the book.
and it doesn't matter what I think of them. It doesn't matter whether I care about these claims, and it doesn't matter whether believing them satisfies any of our desires. Neither personal opinion nor conventional wisdom makes these claims true. They are true and would remain true even if no one believed them.

But are there any objective moral truths? That's not so clear. There are plenty of reasons for doubt; the most popular and important of these will be the focus of our final chapter. If such doubts are correct, then ethical objectivism must be false. Ethical objectivism is the view that some moral standards are objectively correct and that some moral claims are objectively true.

Before having a look at these criticisms of ethical objectivism, let us consider the alternatives. This requires that we sort out the various forms that moral skepticism can take. (And it means just a little more jargon. I'm sorry.) There are basically two forms of moral skepticism: moral nihilism and ethical relativism.

Moral nihilism is the view that there are no moral truths at all. Taking a close, hard-nosed look at what is real and what isn't, nihilists place morality squarely in the latter camp. The world contains no moral features. Don't be fooled by our common talk of genocide's immorality or a murderer's evil nature. That sort of talk is either just plain false, or a disguised way of venting our feelings (of hatred, disgust, etc.)

According to the moral nihilist, when we take a step back from the issues that engage our emotions, we can see that nothing is right, and nothing wrong. The world will one day be fully described by science, and science has no need of moral categories. In the words of the brilliant Scottish philosopher David Hume (1711–76), we gild and stain a value-free world with our feelings and desires. When we declare a murderer wicked or a relief worker good and kind, we are expressing our anger or our admiration. We are not stating a fact. We couldn't be, since there is no moral reality to describe. As a result, no moral claims are true.

By contrast, ethical relativists claim that some moral rules really are correct, and that these determine which moral claims are true and which false. Many are true. People sometimes get it right in ethics, and they do that when their beliefs agree with the correct moral standards.

But these standards are never objectively correct. Rather, these standards are relative to each person or each society. A moral standard is correct just because a person, or a society, is deeply committed to it. That means that the standards that are appropriate for some people may not be appropriate for others. There are no objective, universal moral principles that form an eternal blueprint to guide us through life. Morality is a human construct—we make it up—and like the law, or like standards of taste, there is no uniquely correct set of rules to follow.

These two brands of moral skepticism are quite different from each other. It pays to treat them separately. We'll keep the focus on ethical relativism in this chapter, and turn to moral nihilism in the next.

Two Kinds of Ethical Relativism

As you may already have noticed, ethical relativism isn't just a single doctrine. It actually comes in two varieties: cultural relativism and individual relativism (usually referred to as ethical subjectivism, a name I'll use from now on). Cultural relativism claims that the correct moral standards are relative to cultures, or societies; ethical subjectivism claims that the correct moral standards are those endorsed by each individual. The difference amounts to whether society, or each person, has the final say about what is right and wrong. This is undoubtedly an important difference, but as we'll see, both the advantages and the drawbacks of cultural relativism and ethical subjectivism are remarkably similar.

Consider subjectivism first. It says that an act is morally acceptable just because (a) I approve of it, or (b) my commitments allow it. An action is wrong just because (a) I disapprove of it, or (b) my commitments forbid it. My commitments are the principles I support, the values I stand for. On this line of thinking, personal conviction is the ultimate measure of morality.

Subjectivists think that there are right answers in ethics, but that these are always relative to each person's values. There is no superior moral code that can measure the accuracy of each person's moral outlook. If subjectivism is correct, each person's moral standards are equally plausible.

Cultural relativism instead locates the ultimate standard of morality within each culture's commitments. It says that an act is morally acceptable just because it is allowed by the guiding ideals of the society in which it is performed, and immoral just because it is forbidden by those ideals.

Both subjectivists and relativists regard people as the authors of morality. On both of these views, morality is made by and for human beings. Before we were around, nothing was right and wrong. If our species ever becomes extinct, morality will cease to exist. The fundamental difference between these two views is whether each person, or each society, gets to have the final say in ethics.
Despite their disagreement about whose views are morally authorita
tive, both ethical subjectivism and cultural relativism share a number of features that make it easy to evaluate them together. Let's have a look.

Some Implications of Ethical Subjectivism and Cultural Relativism

Moral Infallibility

Subjectivism and relativism occupy a middle ground between moral nihil­ism and ethical objectivism. There are legitimate moral standards (contrary to nihilism), but their legitimacy depends crucially on our support (contrary to objectivism).

But subjectivists and relativists do not always see eye to eye. Subjectiv­ists are suspicious of cultural relativism because of their belief that societ­ies can be deeply mistaken about what is right and wrong. If the core principles of a social code can contain some serious moral errors, then cultural relativism is in trouble, since it says that whatever society holds most dear is morally right.

Relativists admit that some social beliefs can be morally mistaken. These are the ones that clash with society's most cherished ideals. But if relativists are right, those ideals can never be immoral, since they just are the ultimate moral standards for each society.

The subjectivists seem to have a valid criticism here. The basic ideals of some cultures do appear to be deeply mistaken. Consider the case of Nuran Halitogullari, a 14-year-old girl from Istanbul who was abducted on her way home from the supermarket. She was raped over the course of six days and then rescued by police. After being reunited with her family, her father decided that she had dishonored their family by having been raped. He then exercised what he regarded as his rightful authority. As he told a newspaper reporter, "I decided to kill her because our honor was dirtied. I didn't listen to her pleas; I wrapped the wire around her neck and pulled at it until she died."

Such "honor killings" usually go unpunished. That's because the cultures in which they are committed often regard them as justified. In such cultures, a family's honor is often dependent on the "purity" of its women. And this purity is measured in how its women dress, in who they have relationships with, and in whether they have been victimized in various ways. Thousands of girls and women over the past two decades alone have been killed because they have worn "Western" clothes, have had premarital sex, have had a boyfriend of a different religion, or have been raped.

Such killings are supported by deep cultural assumptions—(i) that men should have the power of life and death over women; (ii) that women ought to obey their husbands, fathers, and brothers unconditionally; (iii) that a man's feeling of shame is enough to justify killing the woman who has made him feel that way.

These assumptions are found at the heart of many cultures. If ethical relativism is correct, then men in those cultures may be morally required to kill their wives, daughters, or sisters for having shown their bare calves, having kissed the wrong man, or having been raped.

The extreme sexism at the heart of honor killings is but one of many examples that raise doubts about cultural relativism. After all, societies are sometimes based on principles of slavery, of warlike aggression, of religious bigotry or ethnic oppression. Cultural relativism would turn these core ideals into iron-clad moral duties, making cooperation with slavery, sexism, and racism the moral duty of all citizens of those societies. The iconoclast—the person deeply opposed to conventional wisdom—would, by definition, always be morally mistaken. This has struck many people as seriously implausible.

Subjectivism faces a similar problem. The cultural relativist makes societies morally infallible (incapable of error), at least with regard to their foundational principles. Yet subjectivists make each person's basic commitments morally infallible. True, subjectivism allows that people can make moral mistakes, but only if they fail to realize what follows from their own commitments. When it comes to the basic commitments themselves, subjectivism denies that these can ever be false or immoral.

If morality is in the eye of the beholder, then everyone is seeing things equally well. Millions of people have very sincerely endorsed programs of ethnic cleansing, male domination, and chattel slavery. Subjectivism turns these prejudices into moral truths.

Moral Equivalence

Subjectivists grant that your moral values, which very likely oppose the ones just mentioned, are also correct. The biased and the bigoted have no monopoly on the truth. Ethical subjectivism is a doctrine of moral equivalence; everyone's basic moral views are as plausible as everyone else's. This

---

can sound liberating and tolerant, and can be put to good use in cutting arrogant people down to size. Such people usually claim to have found the Truth, and often think that they have a special license to force this Truth on others. If subjectivism is correct, the views of such zealots are no better than those of their intended victims.

But they are no worse, either. If ethical subjectivism is correct, then the moral outlooks of Hitler or Stalin are just as plausible as those of a Nobel Peace laureate. And, as we will see in the final chapter (have a look at argument 5, pp. 326–27), if all moral views are on a par with one another, then this is a threat to tolerance, rather than support for it. That's because those with intolerant outlooks would have a moral view as good as that of their opponents.

Cultural relativists fare a bit better here. They will deny that everyone's moral views are equally plausible. Some people are much wiser in moral matters than others, since some people are better attuned to what their society really stands for. But when it comes to evaluating the basic codes of each society, relativists must allow that every code is equally good. Since the ultimate moral standards are those endorsed by each society, none is better than any other. That may sound egalitarian and open-minded. But what it means in practice is that social codes that treat women or ethnic minorities as property are just as morally attractive as those that don't. That's not an easy thing to accept.

No Intrinsic Value
Here is an ancient moral question: is something good because we like it, or do we like things because they are good? Ethical subjectivism goes for the first option. There is nothing intrinsically good about promise keeping, generosity, kindness, or caring. Subjectivists think that these things are valuable, if they are, only because people approve of them. Were our tastes to change, the morality of such actions and character traits would change with them.

That might strike you as suspicious. If it does, then cultural relativism might seem a good alternative. On that view, moral standards do not depend on the possibly fickle choices of any single person.

Yet cultural relativism faces the same worry. For the relativist, the value of something depends entirely on whether a society's guiding ideals approve of it. When these ideals change, the moral code changes with them. If societies place no value on tolerance, or sexual equality, then in those societies such things have no moral value at all. An open, welcoming society that eventually became a fascist tyranny would not be falling into moral error. If relativism is true, then a society's basic moral ideals (no matter what they stand for) are correct. They are not correct because they measure up to some independent standard. They are correct because a society embraces them.

The problem with such a view is that the ultimate moral principles—whether fixed by each individual or by each society—can be based on prejudice, ignorance, superficial thinking, or brainwashing, and still be correct. According to both kinds of relativism, the origins of our basic moral beliefs are irrelevant. No matter how we came by them, the relativist claims that our ultimate moral beliefs cannot be mistaken.

Questioning Our Own Commitments
If subjectivism is correct, then I know what is right so long as I know what I approve of. That's because my approvals (according to subjectivism) are the ultimate test of morality. But what about the situations where I want to know whether my commitments are worthwhile? In these cases, I know what I like, but am still up in the air about its value.

This sort of puzzlement seems to make sense. I have been in such situations before, where I am unsure of whether I am right to like someone so much, or wrong to be so critical of some action. But if subjectivism is true, this cannot make sense, since my approvals and disapprovals are the ultimate test of right and wrong.

The same sort of problem faces cultural relativism. There is no room in this theory to second-guess the guiding ideals of one's own society, since (by definition) they are the correct moral standards of that society. And yet it seems to make sense to ask whether the basic principles of one's society are morally acceptable. If relativism is correct, however, such questioning shows that you don't really understand what morality is all about.

Moral Progress
It seems that both individuals and societies can make moral progress. We can do this when our actions become morally better than they used to be. But I am thinking here of progress in our moral beliefs. This occurs when more of them are true and, in particular, when our most fundamental beliefs change for the better.

The gradual reduction in racist and sexist attitudes in the United States seems to represent this sort of moral progress. The kind of repentant self-examination that German society undertook (and continues to
undertake) after World War II also seems a clear improvement over Nazi ideology. When I examine my own life, I see several moral views that I held when I was younger that I now regard as seriously mistaken. Maybe you do, too.

The problem for relativism and subjectivism is that it can't make sense of the most basic kind of moral progress. If a person's or a society's deepest beliefs are true by definition, then they cannot change for the better. They can change, of course. But no such change would mark a moral improvement.

To measure moral progress, you need a standard. In ethics, that standard is the ultimate moral rule (or rules, if we are pluralists). If subjectivism is correct, that ultimate rule is personal opinion. If relativism is correct, that ultimate rule is given by a society's basic ideals. These cannot be mistaken. If a society gradually eases out of its deeply sexist attitudes, for instance, that cannot be moral progress. That can only be a change to a different moral code. And if relativism is correct, different moral codes are not better or worse than one another. They are morally equivalent.

If subjectivism is correct, then inmates who experience a change of heart while in prison, who adopt new aims of charity and repentance, cannot be showing moral progress. If relativism is correct, then a society that rejects its earlier ideals of racial purity and genocide cannot be making moral progress. That is difficult to believe.

Ethical Subjectivism and the Problem of Contradiction

A final problem for both theories is one that you've probably already thought of. It is the problem of contradiction. A contradiction occurs when a statement is said to be both true and false at the same time. It's a contradiction, for instance, to both assert and deny that the Empire State Building is in New York. Theories that generate contradictions are incoherent. They can't be true; they are muddled and inconsistent.

It looks like subjectivism leads to contradiction. We can see this by considering its test of truth and falsity:

\[(S) \text{ A moral judgment is true if it accurately reports one's feelings or commitments, and is false otherwise.}\]

If (S) is correct, then people on opposite sides of a moral debate are both saying something true. The pro-choicer is speaking the truth when saying that abortion is morally right. And the abortion opponent is also speaking the truth when saying that it is immoral. But abortion can't be both right and wrong. That is a contradiction.

We can summarize the worry in the Contradiction Problem for Subjectivism:

1. Any theory that generates contradictions is false.
2. Ethical subjectivism generates contradictions.
3. Therefore, ethical subjectivism is false.

Premise 1 is definitely true. A theory is incoherent if it tells us that the same claim is simultaneously true and false. So subjectivists have to find a way to attack 2.

They have done that. There is a subjectivist strategy for avoiding contradiction, but it has its costs. The solution implies that we usually don't mean what we say in our moral debates. What we say are things such as the following:

- The death penalty is immoral.
- Abortion is wrong.
- Eating animals is okay.

But what we mean is this:

- The death penalty is wrong, according to me.
- I disapprove of abortion.
- As I see it, eating animals is okay.

And just like that, the contradictions disappear!

Suppose that you and your friend disagree about whether eating animals is wrong. You say it is; she says it isn't. As the subjectivist sees things, you are saying that you disapprove of meat eating; she says that she approves of it. These claims don't contradict each other. This sort of strategy will work across the board, for all moral claims, and so we can save subjectivism from contradiction.

Here are the costs. First, subjectivists have to accuse nearly everyone of misunderstanding their own moral claims. And second, such a view eliminates the possibility of moral disagreement.

To illustrate the first problem, consider this conversation:

**ME:** Genocide is immoral.

**SUBJECTIVIST:** What I'm hearing is—you disapprove of genocide.

**ME:** Yes, I disapprove of genocide. But that's not what I'm saying. I'm not talking about my attitudes. I'm talking about genocide. You're changing the subject.
Subjectivists can’t make sense of my reply here. It’s not that my reply might be false. Rather, my reply is unintelligible, since it assumes that moral talk is about something other than my own commitments. Most of us assume precisely that. If subjectivism is right, we are badly mistaken.

In order to avoid the problem of contradiction, subjectivists have to say that our moral assertions report facts only about our own commitments. When I say that genocide is wrong, I am not saying that it has a certain feature—wrongness. I am saying that I disapprove of it or that my principles forbid it. I am talking about myself. That’s not what most people think they are doing when they make their moral judgments.

The second problem is even more serious. Subjectivism is unable to explain the existence of moral disagreement. In order to avoid generating contradictions, subjectivists have to understand all moral judgments as reports of personal approval or disapproval. The claim that meat eating is wrong becomes the claim that I disapprove of meat eating. The judgment that bravery is a virtue becomes the claim that bravery is something I admire. And so on. But on this line, moral debates that seem to involve intense disagreement become something completely different. In fact, it now becomes impossible for people to morally disagree with one another.

To see this, imagine an earlier dispute.

You say: It’s wrong to eat meat.
AND YOUR FRIEND SAYS: It’s okay to eat meat.

The subjectivist translates this as follows:

You: I disapprove of eating meat.
YOUR FRIEND: I approve of eating meat.

The contradiction has indeed disappeared. But so has the disagreement. If you are both taking this seriously, you’ll agree with your friend’s claim, and she with yours. If all that moral judgments do is report people’s outlooks, then there is no way to morally disagree with anyone who is speaking sincerely. But that seems plainly wrong.

In short, subjectivism faces a dilemma. If we take moral claims at face value, then subjectivism generates contradictions, and so it must be false. If we reinterpret all moral claims to be focused on our attitudes, then the contradictions disappear, but so, too, does moral disagreement.

Cultural Relativism and the Problem of Contradiction

Cultural relativism faces the same dilemma. It says that a moral judgment is true just because it correctly describes what a society really stands for. For instance, if different societies disagree about the appropriate political status of women, then members of each society are speaking the truth when they assert (or deny) female moral equality. But they can’t all be right. The statement that women are deserving of full political equality cannot be simultaneously true and false.

Relativists can escape this problem in familiar ways. They will claim that moral judgments are true only relative to social agreements. On this line of thinking, moral judgments are just like legal ones. It isn’t contradictory to say that smoking marijuana, for instance, is both legal and illegal, so long as we qualify things to note that it is legal in some areas and illegal in others.

Relativists will say that all of our moral claims have to be understood by reference to social agreements. When you say that meat eating is right, and your Hindu friend from Calcutta says that it is wrong, what is really being said is this:

YOU: Meat eating is accepted by my social customs.
YOUR FRIEND: Meat eating is forbidden by my social customs.

And again, both of these claims can be true. The contradiction disappears. There is no single judgment that is both true and false.

But then the existence of cross-cultural moral disagreement also disappears. The same pattern we just saw in the meat eating case will constantly repeat itself. If all we do when making moral judgments is to issue sociological reports about what our society stands for, then cross-cultural moral disagreement vanishes. We are no longer talking about (say) meat eating, abortion, or drug use. We are talking about how our society feels about such things.

But it doesn’t seem as if that is what serious moral debate is all about. For instance, it appears possible to note that one’s society approves of making wives domestic slaves and yet to disagree with the morality of that policy. But that’s not so if relativism is to escape the contradiction problem.

So the cultural relativist faces the same dilemma as the subjectivist. If moral claims are taken literally, then relativism generates contradiction. If moral claims are instead veiled reports of cultural commitments, then contradictions disappear, but cross-cultural disagreement becomes impossible.
Indeed, the relativist is in one way more vulnerable than the subjectivist here; the cultural relativist may be unable to escape contradiction after all.

People who are members of subcultures—smaller cultural groups located within larger ones—often face a familiar problem. They are forced to choose between allegiance to the larger society and to their particular subculture. They are members of at least two societies, and when their ethical codes conflict, these unfortunate people are faced with contradictory moral advice.

This isn’t some philosopher’s fiction. Such cases happen all the time. We could easily multiply examples, but this famous one from my home state should be enough to make the point.

Consider the facts of Wisconsin v. Yoder, a case resolved by the U.S. Supreme Court in 1972. Wisconsin then required regular school attendance of all children up to the age of sixteen. The sons of three Old Order Amish families had stopped going to school after the eighth grade, in obedience to their parents’ beliefs that continued schooling would conflict with their religious values. The students were found guilty of violating the state law, but the verdict was overturned by the state’s supreme court. Wisconsin then appealed to the U.S. Supreme Court, which sided with the Amish families.

In its decision, the Court’s majority announced the following:

They [the Amish families] object to the high school, and higher education generally, because the values they teach are in marked variance with Amish values and the Amish way of life; they view secondary school education as an impermissible exposure of their children to a “worldly” influence in conflict with their beliefs. The high school tends to emphasize intellectual and scientific accomplishments, self-distinction, competitiveness, worldly success, and social life with other students. Amish society emphasizes informal learning-through-doing; a life of “goodness,” rather than a life of intellect; wisdom, rather than technical knowledge; community welfare, rather than competition; and separation from, rather than integration with, contemporary worldly society.

The schoolchildren lived in (at least) two societies at once: their Amish community and the larger state of Wisconsin. If relativism is correct, then the morality of your actions depends entirely on whether they are allowed by the standards of the society they are performed in. But if you live in different societies, and their ethical codes clash, then your actions will be both moral and immoral. That is a contradiction.

We could solve this problem if we could figure out which society’s code is more important. But relativism doesn’t allow us to do that. By its lights, no society’s moral code is any better than another’s. We might be tempted to let the children decide, and say that the social code that takes priority is the one that the children prefer. But this would undermine cultural relativism, since such a move would make the morality of their actions depend on personal choice. They would get to pick the code that is to govern their lives. That is subjectivism, not relativism.

Indeed, critics of cultural relativism often say that the doctrine eventually collapses into subjectivism. When your views and society’s views clash, why think that society is always right? If morality is created by humans, then it is hard to justify the claim that moral wisdom always lies with the masses rather than with individuals. The majority may have the power to force the minority to do as it says. But might doesn’t make right.

Subjectivists claim that in conflicts between personal and social commitments, the individual is always morally wiser. Cultural relativists take the opposite line. But perhaps things are not so cut and dried. Sometimes individuals have the upper hand; sometimes societies do. And sometimes, perhaps, both individuals and societies are mistaken, even in their deepest commitments. If that is ever so, then we must look elsewhere for an account of morality’s true nature.

Ideal Observers

There is a natural way to fix some of these problems for the subjectivist and relativist. We should guarantee that those who create the moral law (whether each individual or whole societies) are not choosing from ignorance, but are equipped with full information. We should also make sure that they are reasoning clearly and avoiding logical errors. In other words, rather than allow us as we actually are (warts and all) to have the final word in morality, we should make the desires and choices of ideal observers the ultimate standard of morality. Ideal observers can survey the scene more dispassionately, more knowledgeably, and more rationally. They are better suited to inventing the moral law than we mere mortals are.

According to this new and improved version of subjectivism, an act is morally right just because I would favor it were I fully informed and perfectly rational. The relativist version says that acts are morally right just
because a society would approve of them were its members fully informed and rational.

This will surely correct some of the problems that we have noted: (1) Even the core moral beliefs of individuals and societies may now be mistaken, as their views may fail to measure up to those of the ideal observers. (2) The views of individuals and societies will not be morally equivalent, since some will better match those of the ideal observers. (3) The sincere endorsements of slavery and genocide will not automatically be morally authoritative, since such endorsements are almost always based on ignorance and irrationality. (4) Moral progress will now be possible, and will occur when the moral views of individuals and societies more closely reflect those of ideal observers. (5) There will be real disagreement between conflicting moral views, since moral judgments will not be reports of personal opinion or cultural consensus, but will rather be claims about what ideal observers will approve of.

These are real improvements. But ideal observer views are not problem-free. In fact, there are two serious concerns. The first occurs if there is ever any disagreement among ideal observers. The ideal observer view says that perfectly rational and intelligent people create morality through their choices. If that is so, then if such people make conflicting choices, this will cause contradictions. And contradictions fatally undermine any theory that contains them.

Perhaps perfectly smart and rational people will never disagree about anything. But why the optimism? Those who know all there is to know about embryology, for instance, might still morally disagree about abortion. After all, on the ideal observer views, such geniuses are not trying to understand the morality of the actions they are assessing. Before they make their decisions, there is no morality. Ideal observers don't respond to a world with moral features. Their preferences and choices create morality. But then there doesn't seem to be anything to prevent them from having conflicting attitudes. If they do, contradiction results.

I think that there is a successful solution to this problem. We can borrow a strategy we've seen before, when discussing a similar problem that arose for social contract theories and virtue ethics. The strategy tells us that an action is morally required or forbidden only if all ideal observers agree in their attitudes about it. If all ideal observers endorsed an action, then it would be morally required. If they all opposed it, it would be forbidden. And if they disagreed on the matter, then it would be morally permitted—neither required nor forbidden. By making morality depend on the attitudes of all ideal judges, rather than each one individually, this theory can indeed avoid contradiction.

But another problem cannot be handled so easily. The view on the table says this: nothing is intrinsically right; things become right just because an ideal observer would favor it. But what if such people thought that killing off the mentally ill was a great idea? What if they thought that sadism was preferable to compassion? What if they approved of apartheid policies?

You might think such a thing impossible. But why? Evil people need not be factually ignorant or illogical. Vast knowledge doesn't guarantee a sympathetic nature. Greater logical skills don't automatically translate to greater kindness. Even the most rational and well informed among us can be biased, hateful, and cruel.

Recall how we got here. Subjectivism and cultural relativism allow the basic views of individuals or societies to determine the ultimate moral standards. But such basic views can be the product of ignorance, bias, and poor reasoning. We tried to fix this problem by changing the theories so that the authors of morality were ideal versions of us. They would be people with perfect information, and perfect logical skills. And yet, as we've seen, this modified view has troubles of its own, and fails to solve the worry that led to its creation. The very smartest people can also be the coldest and cruelest.

This is a deep problem for ideal observer views. In fact, the problem should be a familiar one, since it is the same one that threatens the divine command theory. The divine command theory says that no acts are intrinsically right or wrong; their morality depends entirely on whether God approves of them. On this view, acts are morally right just because God insists that we do them, and wrong because He loathes them.

The basic problem is that actions don't become right just because someone (even God) happens to favor them. Think back to our earlier discussion of the Euthyphro dilemma. Either God has reasons for His commands or He doesn't. If He doesn't, then the commands are arbitrary, and can't

provide the basis for a legitimate morality. But if God does have reasons for 
His commands, then these reasons, rather than God's say-so, are what 
explain why various actions are right. God can ratify the moral standards. 
He can know every one of them. He can convey them to us. But He cannot 
be their author, on pain of resting morality on arbitrary foundations.

The same line of reasoning works to undermine all of the views we 
have considered in this chapter: Subjectivism, cultural relativism, and 
ideal observer theories all share the same basic structure. On these views, 
nothing is right or wrong in and of itself. Actions have the moral status 
they do only because I or my society actually approve of them, or would 
approve of them if we were perfectly intelligent. How can the decisions of 
any such person or group be so powerful as to transform a valueless activ­
ity into something good or right?

These morally all-powerful people either are or aren't basing their 
decisions on good reasons. If there are no good reasons to support their 
decisions, then the decisions are arbitrary, and cannot be the basis of a 
morality worthy of our respect. But if there are good reasons to support 
the decisions, then the reasons, rather than the decision, determine the 
morality of the actions in question.

Suppose, for instance, that I (or my society or an ideal observer or 
God) have reasons that support my disapproval of torture. And these are 
the reasons: the pain it imposes, its unreliability as a source of valuable 
information, the disrespect it reveals, and the way it renders its victims 
utterly powerless. If these really are good reasons, then they are all that's 
needed to make torture wrong. My disapproval doesn't add anything to 
these reasons. If I am really wise, then my disapproval can be very good 
evidence of something's immorality. But the approval cannot turn a morally 
neutral action into a forbidden one.

Socrates' argument against the divine command theory is just as pow­
nerful when brought against subjectivism, relativism, and ideal observer 
theories. If his line of reasoning is correct, then our approval is not enough 
to make something right. Acts are right because they are supported by 
excellent reasons, and not because individuals or groups just happen to 
favor them.

Conclusion

Both cultural relativism and ethical subjectivism are popular ways of chal­
lenging the idea that morality is objective. But as we've seen, both theories 
face a similar set of problems. They make all moral views or all social codes 
morally equivalent. They make the deepest commitments of each person 
or each society morally infallible, even if the commitments are based on 
ignorance or prejudice. Neither theory offers a way to evaluate our guiding 
ideals, since these ideals are said to be true by definition. Neither theory 
allows for fundamental moral progress. Both theories generate contradic­
tions, and can eliminate this worry only by making moral disagreement 
impossible.

This laundry list of complaints explains why cultural relativism and 
ethical subjectivism have found little favor among philosophers. For those 
with doubts about the objectivity of morality, nihilistic alternatives may 
have more to offer.

Discussion Questions

1. What is the difference between cultural relativism and ethical subjectiv­
ism? Why are both theories inconsistent with ethical objectivism?
2. In what sense does ethical subjectivism make us morally infallible? Is 
this an advantage or a disadvantage of the theory?
3. Can ethical relativism make sense of the idea of moral progress? Does 
moral progress really exist?
4. One might object that the theories of ethical subjectivism and cultural 
relativism both generate contradictions. How might a subjectivist or 
relativist respond to this criticism? Do you find their replies to be 
adequate?
5. How does the notion of an "ideal observer" solve some of the problems 
with relativism and subjectivism? What do you think is the most serious 
objection to ideal observer theories? Can this objection be overcome?
CHAPTER 20

Moral Nihilism

There are basically three options when it comes to determining the status of morality. Morality might be objective, its rules applying to us independently of our opinions and desires. Or it might be relativistic, and depend for its authority on personal or cultural preferences. Finally, morality may simply be a kind of make-believe, a complex set of rules and recommendations that represents nothing real. This last option is known as moral nihilism (from the Latin word nihil, meaning "nothing").

Moral nihilists join with relativists in opposing ethical objectivism. Morality is wholly a human creation—in this, nihilists and relativists are united. But nihilists are no fans of ethical relativism. Relativists believe in moral goodness, moral duty, and moral virtue. Nihilists don't. Nihilists deny that there are any moral qualities. There are no moral requirements. Nothing is morally good. Nothing merits praise or blame.

According to nihilists, there is a rigid fact-value distinction, which basically says that there is a sharp difference between facts and values. As nihilists see things, values are on the wrong side of the divide. Facts exist; values don't. Value claims cannot be factual, and so cannot be true. Factual claims inform us of things; value claims are not informative, since they describe nothing. You might think that it's a fact that betraying a friend is immoral, or a fact that happily giving to the needy is morally virtuous. But if nihilism is right, there are no such facts. Facts are real; values aren't.

There are two important forms of moral nihilism: the error theory and expressivism. Error theorists claim that our moral judgments are always mistaken. Expressivists deny this, while also denying that our moral claims can ever offer an accurate take on reality. Expressivism is the more complicated doctrine, so let's ease our way into the nihilist camp by first considering the error theory.

Error Theory

Did you ever have the feeling, deep down, that morality is a sham? That it's just a set of traditional rules inherited from ancestors who based it on ignorance, superstition, and fear? Perhaps it's only a convenient fiction, with no underlying authority at all.

The error theory of morality is built upon these doubts. It is defined by three essential claims:
1. There are no moral features in this world. Nothing is morally good or bad, right or wrong, virtuous or vicious. A careful inventory of the world's contents will reveal all sorts of scientific qualities: being symmetrical, being a liquid, being two feet long, carbon-based, spherical, and so on. But the list will contain no moral features.
2. No moral judgments are true. Why not? It's simple: there is nothing for them to be true of. There are no moral facts. And so no moral claims can be accurate, since there are no moral facts for them to record.
3. Our sincere moral judgments try, and always fail, to describe the moral features of things. Thus we always lapse into error when thinking in moral terms. We are trying to state the truth when we make moral judgments. But since there is no moral truth, all of our moral claims are mistaken. Hence the error.

It follows that:
4. There is no moral knowledge. Knowledge requires truth. If there is no moral truth, there can be no moral knowledge.

Error theorists are not launching some small-scale attack on morality. They are not criticizing our current views on, say, welfare policy or capital punishment, and trying to replace them with better ones. Rather, as they see it, all moral views are equally bankrupt. There is some very deep mistake that everyone committed to morality is making. The error theorist promises to reveal that mistake, and so to expose the real truth: morality is nothing but a fiction.
For those who are fond of analogies, the following may help. The error theory is to morality as atheism is to religion. Error theorists and atheists are skeptics. They deny the truth of a widely accepted worldview. They do this by trying to pinpoint an error that is said to lie at the very heart of the system they oppose.

Atheists, in effect, error theorists about religion. They believe that there are no religious features of the world, that no religious claims are true, and that religious believers try (and always fail) to speak the truth about God. They deny that there is any religious knowledge. The central explanation for all of this is simple. If atheists are right, then common religious claims (God speaks to me; God created the universe; God knows everything) are all wrong, because they are based on the mistaken assumption that God exists.

Atheists can successfully defend their view only if they can convince us that there is an error at the heart of religious belief. Likewise, moral error theorists can vindicate their view only if they can show that there is some fatal flaw at the heart of morality.

And that depends on what the fundamental error of morality is supposed to be. In principle, we can develop any number of error theories, depending on which basic error morality is supposed to commit. But in practice, there really has been only one candidate.

All error theorists have agreed that the core mistake that undermines morality is its assumption that there are objective moral standards that supply each of us with an excellent reason for obedience, regardless of what we care about. According to error theorists, just as religion crucially depends on the supernatural, morality essentially depends on its being objective and providing us with *categorical reasons*—reasons that apply to us regardless of whether acting on them will get us what we want.  

1. For more on categorical reasons, please see the discussion in chapter 11, pp. 162–63.

But suppose that the coherence of our moral thinking and practice does indeed depend on the twin assumptions that morality is objective and that it provides us with categorical reasons. This reveals the second burden that error theorists must shoulder: they must show that at least one of these assumptions is false.

Perhaps they can do that. We have already considered arguments concerning our reasons to be moral, and will (in the next chapter) look at the most prominent attempts to undermine the objectivity of morality. So, rather than repeat those efforts, let us consider some implications of the error theory.

Though very few people outside of philosophical circles have ever heard of the error theory, the worry it expresses is familiar enough. And so, too, is the typical response: abandoning morality would have absolutely terrible results. Further, even to seriously consider that morality may be a fiction is to show a corrupt mind, and error theorists are therefore not to be trusted. Once people give up on morality, they will feel free to act in any way they please. It won't be pretty.

There are actually two lines of criticism at work here, and both are mistaken. The first we might call the *Argument from Disastrous Results*:  

1. If widespread acceptance of a view would lead to disastrous results, then that view is false.
2. Widespread acceptance of the error theory would lead to disastrous results.
3. Therefore, the error theory is false.

It's an interesting question whether premise 2 is true. I won't venture an opinion here on whether it is. Nor do we need to, since premise 1 is definitely false. The truth of a theory does not depend on the results of everyone's embracing it.

To see this, consider a similar argument against atheism. Some people claim that widespread belief in atheism would generate disaster. I don't know if that's right, but suppose it is. Still, that is no evidence that God exists. After all, if some highly classified state secrets were revealed and became widely accepted, that might cause disaster, too. But that hardly shows that the claims made in those documents are false. So we cannot undermine the error theory by arguing that its popular acceptance would lead to the downfall of civilization—even if it would.

Some have found premise 1 tempting because they have confused it with a close cousin:

1a. If widespread practice of a given action will lead to disastrous results, then that action is immoral.

But this really is a confusion, since premise 1 speaks of theories and their truth, rather than actions and their moral status. And in any event, 1a is false, as we saw in an earlier discussion. If everyone were to practice celibacy, then disaster would ensue. That doesn't show that it is immoral to be celibate.

Others have confused premise 1 with a more specific version:

1b. If widespread acceptance of a moral theory would yield disastrous results, then that theory is false.

This cannot be so easily dismissed. Many philosophers have thought that 1b is true, though a number of others—mostly utilitarians—have rejected it. Fortunately, we do not have to settle the matter here, because the error theory is not a moral theory. It does not try to tell us where our duty lies, or which character traits are virtues. The error theory rejects all moral theories, and says that every single one is mistaken. Since the error theory is not a moral theory, principle 1b simply does not apply to it.

If the error theory isn't a moral theory, then what is it? In fancy terms, it is a metaphysical theory—a theory about what the world is truly like, and what really exists. Theism is a metaphysical theory. It says that God exists. Other metaphysical theories try to defend the existence of the soul, or free will, or immortality.

The basic problem with the Argument from Disastrous Results is that metaphysical theories cannot be tested in the way that its first premise claims. For instance, we cannot prove that we have free will, just by showing (if we can) that terrible results would occur if we abandoned our belief in it. Metaphysical theories try to tell us what the world is like. Such theories might contain some bitter truths, ones that, if widely accepted, would lead to heartache, or loss of faith, or the breakdown of longstanding customs and social practices. (That's what makes them bitter.) At best, this

4. Many utilitarians think that widespread acceptance of the principle of utility might actually have quite bad results, despite firmly believing that the principle is true. See chapter 10, p. 139 for a discussion of this point.

might give us some reason not to publicize these claims. But that is no reason to suppose that they are false.

Another popular objection to the error theory is really targeted at error theorists themselves. The idea here is that those who reject categorical reasons and the objectivity of morality are bound to be untrustworthy. Conscience serves as an effective check on our antisocial impulses only if we see moral duty as something real, as a set of rules imposed from the outside, ones that have genuine authority over us. Error theorists reject this picture, and so will feel free to let their destructive, self-interested impulses take control of their decisions. Since error theorists are so untrustworthy, the views they put forth are not to be trusted, either.

But this way of thinking is mistaken as well. Error theorists can care deeply about others, and can be strongly opposed to doing the things that we traditionally regard as morally wrong (killing, raping, stealing). Of course error theorists, if consistent, will not regard such actions as immoral. But they may still be dead set against such behavior; they might find it distasteful, undesirable, unproductive, or otherwise unappealing.

Still, one might argue that error theorists are not guaranteed to have the sorts of goals that we associate with upright behavior. And that is true. But then again, such a guarantee fails to hold for many people who reject the error theory. How many atrocities each year are committed in the name of one morality upon those with different moral beliefs? Far more than are committed by error theorists!

All that aside, this kind of criticism does nothing to address the issue of whether the error theory itself is true. Indeed, it represents a classic kind of fallacy—the *ad hominem attack*. When leveling such a critique, one tries to undermine the truth of a position by criticizing the character of its supporters. Don't like the message? Attack the messenger. Aside from being bad sport, such a strategy entirely misses the mark. We want to know whether morality is all make-believe. We can't answer that question by engaging in character assassination.

The only way to answer it is by doing two things. First, we need to determine whether error theorists are correct in thinking that morality really does depend on two assumptions: (i) that it is objective, and (ii) that it supplies us with reasons to obey it, regardless of our desires. I am not sure about whether this is what we really are committed to when thinking morally. Certainly, subjectivists and relativists deny these assumptions. And so they will deny the existence of any error, since they reject the thought that morality depends on claims (i) and (ii).
But suppose that error theorists are right about what we are committed to when we adopt a moral outlook. To defend their view, they must then show that categorical reasons do not exist, and that morality is not objective. Can they do this? Stay tuned.

Expressivism

Expressivism is another family of views that deny the objectivity of morality. Indeed, expressivists accept the first two claims that define the error theorist’s point of view:

1. There are no moral features in this world.
2. No moral judgments are true.

Unlike error theorists, however, expressivists think that morality is in pretty good shape. There is no deep error at the heart of our moral thinking. But how can that be, if 1 and 2 are true?

Simple. Expressivists reject the third feature that is essential to error theory:

3. Our sincere moral judgments try (and always fail) to describe the moral features of things.

According to expressivists, we are not trying to speak the truth when making moral judgments. We are not making an effort to describe the way the world is. We are not trying to report the moral features possessed by various actions, motives, or policies. Instead, we are venting our emotions, commanding others to act in certain ways, or revealing a plan of action. When we condemn torture, for instance, we are expressing our opposition to it, indicating our disgust at it, publicizing our reluctance to perform it, and strongly encouraging others not to go in for it. We can do all of these things without trying to say anything that is true.

One of the basic ideas behind expressivism is that moral claims function very differently from straightforward factual claims. Factual claims try to represent the way the world really is. If expressivism is right, moral claims serve quite different purposes.

I know that sounds puzzling. To get a better sense of what is going on here, consider this sentence:

(A) Torture is immoral.

It appears to function just like this sentence:

(B) The sea is salty.

Sentence (B) tell us that the sea has a certain feature—being salty. Sentence (A) looks similar. It tells us that torture has a certain feature—being immoral. And there's nothing special about (A). All moral claims seem to assign a moral quality to something or other. But if there aren't any such qualities, then aren't our moral claims always mistaken?

Not necessarily. If expressivism is true, then the similarity between sentences such as (A) and (B) is only superficial. When we say that torture is immoral, for instance, we are not describing torture. We are not saying that it has any features at all. We aren't even describing our feelings about it (as subjectivists claim). Rather, it's as if we were saying one of the following:

• Torture—argghhh!
• Don't torture!
• Let me plan a life that doesn't include torturing others.
• Won't everyone please refrain from torture?

These utterances can't be true. But they can't be false, either. And that's the central difference between expressivism and error theories. The error theorist thinks that our sincere moral claims are always meant to state the truth, but since there isn't any moral truth, such claims are all mistaken. The expressivist, by contrast, thinks that our moral claims are largely all right, since they are doing what they are intended to do.

And what is that? According to expressivists, moral claims are not in the business of holding up a mirror to the world. Their job is to vent our feelings, give orders and commands, and express our commitments. Since they manage to do that just fine, there is no reason to charge them with error.

The basic philosophical motivation behind expressivism is pretty straightforward. Expressivists want a way to have confidence in morality while rejecting ethical objectivity. In doing so, they also want to avoid the difficulties that hamper cultural relativism and ethical subjectivism.

The biggest problem for relativism and subjectivism (as we saw in the previous chapter) is that these views either generate contradictions or are unable to explain moral disagreement. Expressivists handle both problems with ease.

Contradictions arise when the same claim is said to be true and false at the same time. If expressivists are right, no moral claim is either true or false. And so moral contradictions disappear.
Expressivists see moral disagreement as a clash of emotions or personal commitments. Debates about torture, for instance, reveal nothing about torture's moral features (since there aren't any), but a lot about the feelings of the differing parties. One side feels angered and upset by torture, and the other doesn't. The emotional investment we see in so many moral debates is just what we should expect, given the expressivist analysis of moral disagreement.

Expressivists cannot escape the worry about moral equivalence, however. Their official view is that there are no moral values, and no moral truth. If that is so, then all moral views are on par with one another. Some such views may be more internally consistent than others; some may contain fewer factual errors; others may be more likely to bring happiness or contentment. Yet none of these things makes a moral view closer to the truth.

There are further worries. Three seem to be especially serious.

How Is It Possible to Argue Logically about Morality?
If, as expressivists say, moral claims cannot be true, then this makes it very difficult to understand how moral argument is possible. Logical argumentation is truth preserving—a logically valid argument is defined as one whose conclusion must be true, provided that its premises are true. If, as expressivists say, moral claims cannot be true, then how could they possibly be used to support other claims?

To see the worry here, consider this argument:
1. All actions that dehumanize people are immoral.
2. Torture dehumanizes people.
3. Therefore, torture is immoral.

The argument appears to be logically perfect. If you accepted both premises, you would have to accept the conclusion. After all, this argument has the very same logical structure as a philosophical classic:
1. All men are mortal.
2. Socrates is a man.
3. Therefore, Socrates is mortal.

And everyone admits that this argument is logically valid. Given the truth of the two premises, the conclusion can't possibly be false.

From a logical point of view, these two arguments appear to be identical. And there is a natural explanation for this: the first two premises in each argument can be true, and if they are, then the conclusion must be true as well. But expressivists cannot accept this natural explanation, since they deny that moral claims can be true.

Look at the first argument. If premise 1 really means:
1a. Dehumanizing actions—yecchhh! or
1b. Don't dehumanize people!

then there is no way that this premise can be used to logically support any conclusion. But it seems clear that it is being used in precisely this way. The logic of the first argument is watertight—even if you are suspicious about the merits of the actual premises. Indeed, logical moral argumentation seems like a real possibility—we do it all the time (and have been doing it throughout this book). Expressivism does not seem able to explain this.

Expressivism and Amoralists
An amoralist is someone who sincerely makes moral claims, but is entirely unmoved by them. Such people create a serious problem for expressivism. Expressivists warn us not to be fooled by the superficial similarity between factual claims (the sea is salty) and moral ones (torture is immoral). Moral claims assert nothing. They describe nothing. Instead, they express our feelings. Indeed, that is how the expressivist explains why our moral judgments so reliably motivate us. These judgments convey our feelings, and our feelings are what move us to act.

But this makes it impossible for someone, say, to really think that charity is admirable and yet be indifferent when it comes to forking out his own money. It would be impossible for a soldier to think it his duty to face enemy fire, while remaining completely unmotivated to do so. Such cases may really be impossible. But the evidence points the other way. Amoralism is unusual, to be sure, but not unheard of.

Indeed, expressivism faces the same problem that psychological egoism does. In the face of evidence that supports the existence of altruism, egoists insist that people must be either deceiving themselves or lying to us.

5. For more on logic and validity, please see the Introduction, pp. 9–10.

about their motivations. Expressivists have to say the same thing about the evidence of amoralism. All such evidence must be disqualified. The person who really is lacking in motivation cannot be sincere in his moral claims. Or, if he is sincere, then he really must be motivated, and so his claims to the contrary are either lies or instances of self-deception. Such a diagnosis may be correct. But the burden here weighs heavily on the expressivist’s shoulders.

The Nature of Moral Judgment
A final concern has to do with whether expressivists are right to challenge the dominant view of what we do when we make moral judgments. Ethical objectivists, ethical relativists, and error theorists agree on almost nothing. But they have reached consensus on one point: moral claims try to tell us about the moral features that things actually have. Moral judgments can be true or false, depending on how well they report the truth about which things have which moral qualities.

Expressivists deny this. They reject the idea that moral claims are trying to represent the way things are. They deny that there are any moral features. They deny that moral judgments could ever offer accurate descriptions of reality. How do we know whether their hypothesis is correct?

Return to our original example, the claim that torture is immoral. If we understand this literally, the sentence says that torture has a certain feature—being immoral. As we saw, expressivists can’t read it this way. They have to paraphrase this sentence so that it isn’t assigning any specific feature to torture. Perhaps you found the various translations they offered (p. 313) to be attractive. But what about these claims?

• Nobody but Jeff knows how to behave when the boss is around.
• I’m not sure whether torture is ever acceptable, but I am sure that some who are wiser than I am have the correct answer.
• There is a difference between an action’s being required, morally good, virtuous, and deserving of praise.
• Some actions fulfill moral duties and yet lack moral worth.
• The degree of punishment should match the degree of wrongdoing.
• Virtue is its own reward.
• If war is immoral, then military generals are less virtuous than they seem.

Read as objectivists, subjectivists, relativists, or error theorists would understandable. It’s not at all clear how expressivists could reword them to turn them into commands, emotional expressions, or plans.

People put their words to various purposes. The best way to tell whether people are joking, questioning, inviting, or trying to state the truth is simply to ask them. People are usually pretty trustworthy on this score. (Not always, of course. When we play to win at poker, or negotiate a business deal, we may be deliberately misleading.) Still, exceptions aside, people are the best judges of their own intentions, and their testimony in such matters is usually reliable.

That’s not a thrilling point, but it has a direct bearing on expressivism’s plausibility. When we ask people how they think of their moral claims, almost everyone will reject the expressivist analysis. For the most part, we do regard our moral claims as true. We regard our opponents’ views as false. We take our moral condemnations to be cases of describing, say, the injustice of insider trading, or reporting the moral corruption of a vicious tyrant. At bottom, we intend our moral judgments to function as something other than emotional outbursts or expressions of commands or plans.

We might all be lying, or deceiving ourselves about what we are actually doing. But by far the more charitable view is that we mean what we say. When making moral judgments, we are trying to speak the truth. We are intending to state the facts. We aim to accurately present the moral details of the situations we are thinking of. If that is so, then expressivism is in serious trouble.

Conclusion
The vision of morality that so many of us believe in—one that sees morality as a set of objective duties and rules, supplying each of us with strong reasons to do as it says—may be fundamentally mistaken. Subjectivists and relativists certainly think so. And so do error theorists and expressivists. Error theorists are the most cynical of the lot, thinking as they do that morality is a bankrupt enterprise. This thought stems from their view that our moral thinking is based on assumptions that turn out to be false. If the foundations of an entire way of thinking are corrupt, then the whole worldview must come tumbling down. That’s the way atheists see religious claims. And that is the way error theorists see moral ones.

Expressivists are not so pessimistic. They agree with error theorists in denying that ethics is objective, and denying that moral duties supply us with categorical reasons. But since expressivists do not believe that moral
thinking rests on these foundations, they don’t feel the need to accuse the rest of us of error. Moral talk does pretty much what it is supposed to do—give vent to our emotions, express our feelings about things, and signal our commitments. And so there is little reason to worry.

But as we have seen, expressivism does give us some cause for concern. True, it offers a picture of morality that frees it of fundamental error. It solves the problem of contradiction. It neatly explains the nature of moral disagreement. It supports our view that emotions are a central part of moral judgment. And yet it has difficulty making sense of how logical moral argumentation is possible. It fails to make room for amoralism. It clashes with our views about what we are intending to do when we make moral judgments.

Expressivists are hard at work on these problems. There is a very lively conversation about the pros and cons of expressivism going on right now in philosophy departments around the world. In the last decade, this conversation has reached levels of sophistication that would have been unthinkable just a generation ago. It’s far too early to tell whether expressivism is down for the count, or whether its defenders can identify new solutions to these perennial problems.

Even if, in the end, expressivism turns out to have more costs than benefits, this doesn’t leave objectivists in the clear. It may be that morality is all make-believe, as error theorists claim. Most of us (especially we textbook authors!) hope this isn’t so. Yet a hope is hardly evidence one way or the other. Whether we should think of morality as bankrupt depends on what the best arguments tell us about the nature of morality. We’ll be in a better position to see the force of those arguments after working through the next chapter.

Discussion Questions

1. What are the two types of moral nihilism, and what is the main difference between them? In what ways does each theory agree with ethical objectivism, and in what ways does each disagree?
2. What do error theorists typically claim is the “error” at the heart of our moral practice? Is the assumption that they identify really essential to our moral thought? If so, do you agree that it is an error?
3. What does it mean to say that stealing is wrong, according to expressivism? Do you find the expressivist translation to be plausible? Why or why not?
4. Why does the fact that people make logical arguments about moral issues raise a challenge for expressivism? How might an expressivist respond to this challenge?
5. What is an amoralist? Can expressivism make sense of the idea of such a person? If not, is this a problem for the theory?
Ethical objectivism is the view that there are some objective moral standards. Given my understanding of objectivity, this amounts to the view that these standards apply to everyone, even if people don't believe that they do, and even if obeying them fails to satisfy a person's desires. Moral claims are objectively true whenever they accurately tell us what these moral standards are, or tell us about what these standards require or allow us to do.

Moral skepticism, as I have defined it here, is the view that ethical objectivism is false, and thus that there are no objective moral rules and no objective moral truths. Unsurprisingly, the pros and cons of ethical objectivism and moral skepticism are mirror images of one another. As with any two contradictory positions, a big reason to favor one side is unhappiness with the other.

Perhaps the biggest reason that so many people are moral skeptics is a suspicion that ethics just cannot be objective. Naturally, objectivists are happy to return the favor, and usually defend their own position by raising their serious doubts about moral skepticism. We've considered the leading skeptical views in the last two chapters, and have noted some of the difficulties they face. If these worries cannot be solved, and if objectivism can be defended against criticisms, then objectivism wins by default. Relativism, nihilism, and objectivism are the three options when it comes to the status of ethics. If two of these can be defeated, then the one left standing must be the correct account.

Objectivists, of course, believe that they'll be the ones standing at the end of the day. Whether they are right about that depends on their ability to handle the many criticisms that have been sent their way. It's now time to focus on these criticisms, to see whether objectivism can respond to them in a satisfying way.

There are many sources of doubt. As we'll see, some of the most popular arguments are also the least plausible. But others represent deep and serious challenges. With the hardest of the objections, it is impossible to offer a final verdict in just a page or two, which is all I will allow myself here. My goal in this chapter is simply to show that, despite widespread doubts about ethical objectivism, none of the most popular skeptical arguments is obviously correct, and some, indeed, are pretty plainly unacceptable. And to those that represent more significant challenges, there are potentially promising replies that objectivists can offer.

Let's consider some of the least plausible arguments first, before turning to critiques of objectivism that are more difficult to handle.

1. Objectivity Requires Absolutism

Many people claim that if morality were objective, then moral rules would have to be absolute. And since they aren't, morality isn't objective after all.

The Argument from Absolutism summarizes this line of thought:

1. If moral claims are objectively true, then moral rules are absolute.
2. No moral rule is absolute.
3. Therefore, moral claims are not objectively true.

An absolute moral rule is one that is always wrong to break—no exceptions.

I don't know if there are any absolute moral rules. If there are, good candidates would include the prohibition on rape and on deliberately killing innocent people. Luckily we don't have to settle this issue here, because even if premise 2 is true, and there are no absolute moral rules, premise 1 is false.

That first premise tells us that when it comes to morality, being objective and being absolute go hand in hand. But that isn't so. The moral rule that forbids us from lying is probably not absolute; in some cases, morality would probably allow us to lie. For all we know, though, that rule could be objective. Ross, for instance, thought that the fundamental moral rules are

1. See chapter 15 for much more detailed discussion of this question.
objective. But he denied that they are absolute. Likewise, if God exists, and creates or reveals the moral law, then morality would be objective. But God might allow us to lie in certain circumstances, and might also permit us (in unusual cases) to break other moral rules. There is nothing in the very idea of an objective morality that requires moral rules to be absolute.

There is a general reason for this. The objectivity of moral rules has to do with their status: with whether they are correct independently of our opinion of them. The absoluteness of moral rules has to do with their stringency: with whether it is ever okay to break them. There is no direct connection between matters of status and stringency. This is clear when it comes to natural laws. Various biological and psychological laws admit of exceptions, and so are not absolute, even though they are objective.

This does not of course show that moral rules are objective. But it does support the view that even if they are, they do not have to be absolute. So premise 1 is false. And since it is, this argument does not threaten ethical objectivism.

2. All Truth Is Subjective

A popular thought in some circles is that claims can be true only relative to individual perspectives. On this line, there are no objective truths at all. Forget about morality for a moment—claims in logic, chemistry, or history can never be objectively true, either. So it's no surprise that objective morality is an illusion. The Argument against Objective Truths couldn't be simpler:

1. There are no objective truths.
2. Therefore, there are no objective moral truths.

The first thing to note about this argument is that, if it works, there is no special problem for morality. Most moral skeptics are trying to show that morality is in some ways second-rate, that it fares poorly in contrast to more precise disciplines such as mathematics and physics. By embracing a global kind of skepticism, this argument abandons that strategy.

The problem with this argument is its premise. Premise 1 is either true or false. If it is false, then the argument crumbles right away. So suppose that it is true. But this is impossible. The premise cannot be true. If it were, then there would be at least one objective truth—premise 1. And if there is at least one objective truth, then premise 1 is false! No matter how we look at it, then, this premise is false.

Since that is so, it follows directly that there are at least some objective truths. Perhaps none of them is a moral one. But we can't rely on this argument to support that skepticism.

3. Equal Rights Imply Equal Plausibility

I have heard countless moral disputes end on this conciliatory note: “Well, everyone has a right to their opinion. You have your view, and I have mine. Maybe we're both right.”

This familiar refrain is sometimes taken one step further in the following way: since everyone has a right to a moral opinion, no one's moral views are any better than anyone else's. And if everyone's moral opinions are on par with one another, then there is no objective moral truth.

These thoughts can be combined into an Argument from Equal Rights:

1. If everyone has an equal right to an opinion, then all opinions are equally plausible.
2. Everyone has an equal right to his or her moral opinions.
3. Therefore, all moral opinions are equally plausible.
4. If all moral opinions are equally plausible, then ethical objectivism is false.
5. Therefore, ethical objectivism is false.

The fourth premise is true. No question about it. If moral standards are objectively correct, then some people's views are going to be very far from the mark, and others are going to be right on target.

I also believe that the second premise is true. Everyone has a moral right to freedom of conscience. Each person is morally entitled to decide for herself what to believe, and not to be brainwashed into thinking what others want her to think.

If I am wrong about that, then so much the worse for the argument, since it obviously relies on the truth of premise 2. But the argument is a failure even if 2 is true, for premise 1 is false.

From the fact that we each have a right to our opinions, nothing at all follows about their plausibility. I was once walking through a forest with a
friend who knows a lot about trees. (I don’t.) I suggested that the one I was looking at was an ash. It wasn’t. He knew it was a larch. Our views were not equally plausible, even though I had as much a right to my opinion as he did his.

There are countless examples of cases in which people have an equal right to an opinion—that is, an equal right not to be forced to change their mind—even though their views are mistaken. Some historical claims are true and others false, even though we each have an equal right to our historical opinions. The same thing can be said of our opinions concerning economics, trigonometry, basketball strategy, or beer brewing. Most people know more than I do about each of these things, and so my views on these subjects are far less plausible than theirs. And yet my right to hold the views I do is just as strong as anyone else’s.

The first premise of the argument confuses two entirely separate matters: whether a person has a right to an opinion, and whether that opinion has any merit. This confusion undermines premise 1, and with it, the argument itself.

4. Moral Objectivity Supports Dogmatism

Pick any blowhard, tyrant, or political fanatic, and there is one thing they all share. They are all ethical objectivists. These are the folks who believe in moral truth with a capital T. Luckily for them, they have managed to discover that Truth. All they are trying to do is to let you in on some of it. This may take some shouting, perhaps some coercion, maybe even some killing, but Truth can be pretty demanding.

This thoroughly unpleasant picture yields the following Argument from Dogmatism:

1. If there are objective moral standards, then this makes dogmatism acceptable.
2. Dogmatism is unacceptable.
3. Therefore, there are no objective moral standards.

Dogmatism is the character trait of being closed-minded and unreasonably confident in one’s own opinions. Dogmatism is a vice, and if a theory recommends that we always close our minds to competing ideas, then that theory is very implausible. So premise 2 looks good. But ethical objectivism does not encourage a dogmatic attitude. The first premise of this argument is false.

By itself, the claim that there are objective moral standards is perfectly neutral about how broad-minded we should be. Ethical objectivism is a view about the status of moral claims. It does not tell us what is and is not morally acceptable. All it says is that the correct moral code, whatever it happens to be, is objectively true.

But we can say more. If moral truth is not of our own making, then it will not always be easy to discover. And that fact should encourage us to be humble, rather than arrogant and closed-minded. The proper outlook of astronomers and geologists and chemists is that of wonder, a recognition of one’s intellectual limitations, and an appreciation that no matter how smart you are, you’ll never know the entire truth about your subject matter. These are appropriate attitudes precisely because there are objective truths in these subjects. Scientists do not get to have the final word about the nature of reality. They might always be corrected by a later generation of thinkers.

If ethics, too, is a subject whose truths are objective, then we should also be open-minded about moral matters. It’s perfectly consistent to say that the answers to some questions are objectively true, even though you’re not sure what those answers are. If, in ethics, our say-so doesn’t make it so, then we are always liable to error. That should give us pause, and it should alert us to the dangers of being dogmatic.

Further, if each person does get to have the final word about morality—if an act is right just because a person approves of it—then people will almost never be morally mistaken. Moral knowledge would be extremely easy to come by. All you’d have to do is to check to see how you feel about an action. If you like it, it’s right; dislike it, wrong. If each person is the measure of morality, then we are practically infallible about moral matters. And that seems to be a perfect recipe for dogmatism. For why should I change my mind, or think myself mistaken, if the chances of error are almost zero?

It is true that the worst fanatics among us are always ethical objectivists. But that is not a strike against the theory. Rather, it is a strike against the individuals who misapply it. Such people fail to appreciate the complexity of morality and the much greater possibility of error that an objective morality allows.

Ethical objectivism is not committed to saying that moral wisdom is easy to get. In fact, as we have seen, objectivism makes such wisdom harder to come by than its competitors do. And so objectivism does not license dogmatism. Thus the first premise of this argument is mistaken. The argument is therefore unsound.
5. Moral Objectivity Supports Intolerance

A very popular reason for rejecting ethical objectivism is a concern for tolerance. People in open societies rightly value tolerance, but many think that tolerance would be threatened if moral standards were objectively correct. If some moral codes are better than others, then what's to stop those with the upper hand from lording it over those who embrace a faulty code of conduct?

Indeed, these critics say that the best way to support tolerance is to assume that all moral views are as good as any other. If that were so, then no one would be in a position to suppress the lifestyles of those who march to the beat of a different drummer. We would have to agree to disagree, since no one's moral outlook would be better than anyone else's. That is what is needed to support tolerance.

We can trace this line of thinking in the Argument from Tolerance:

1. Tolerance is valuable only if the moral views of different people are equally plausible.
2. If ethical objectivism is true, then the moral views of different people are not equally plausible.
3. Therefore, if ethical objectivism is true, then tolerance is not valuable.

That second premise is true. Ethical objectivism rejects the idea of moral equivalence. Some moral views are better than others.

But the first premise is false. In fact, ethical objectivism is much better than moral skepticism at supporting tolerance. The basic reason is this: if all moral views are equivalent, then a tolerant outlook is no better than an intolerant one. The outlook of a committed bigot would be as plausible as yours or mine.

Indeed, we can easily frame a counterargument that shows why the value of tolerance poses a threat to skepticism, rather than to objectivism:

1. If all moral views are equally plausible, then moral views supporting tolerance and those supporting intolerance are equally plausible.
2. These moral views are not equally plausible.
3. Therefore, some moral views are less plausible than others.

The first premise must be correct. And those who value tolerance will want to embrace the second. The conclusion follows directly.

Those who favor tolerance tend to regard its value as universal—good for everyone and every society. This applies especially to areas plagued by intolerance, since tolerance is needed most just where it is least enjoyed. Yet if individuals have the final word on what is morally right, then those who are fundamentally intolerant—intolerant at their core, in their deepest beliefs—are making no mistake. The same goes for societies. If social codes, rather than individuals, are the measure of morality, then deeply intolerant societies are no worse than freer ones. Their rejection of tolerance is as plausible as your endorsement of it. That should be little comfort to those who value tolerance.

Those who think of tolerance as very valuable will want to say that tolerance is morally required even for those people and those societies that despise it. Such a view is perfectly compatible with ethical objectivism.

6. Moral Disagreement Undermines Moral Objectivity

A classic argument against moral objectivity takes its cue from a simple observation: there is a lot more disagreement in ethics than there is in science. And there is a ready explanation for this. Scientists are trying to understand the nature of objective reality, whereas in ethics, there is no objective reality to be discovered. When it comes to morality, we are merely expressing our personal opinions, ones that have been obviously shaped by the time and place in which we've been raised. Different upbringings, different moral outlooks. But scientists the world over can agree on a wide set of truths, no matter their religious or cultural backgrounds.

The Argument from Disagreement nicely summarizes this line of thought:

1. If well-informed, open-minded, rational people persistently disagree about some claim, then that claim cannot be objectively true.
2. Well-informed, open-minded, rational people persistently disagree about all moral claims.
3. Therefore, no moral claim can be objectively true.

Perhaps premise 2 is too strong. Maybe there are some moral claims that every smart, rational, open-minded person accepts. But without a lot more investigation, it would be premature to assume that this is so.

What is clearly true is that for any moral claim—even one you find to be just obvious—there will always be someone else who thinks that it is
false. But that doesn't show that premise 2 is true, since such people may not be well informed, or open-minded, or rational.

Indeed, moral disagreement might well be a product of sloppy reasoning, of not having enough facts under our belt, of having a personal stake in the outcome, or of a general prejudice. What if we were able to correct for these sources of error? Imagine people who were absolutely on top of all of the details, say, of affirmative action policies, who were free of personal bias and other prejudices, and who were able to reason flawlessly. Perhaps they'd all agree about whether affirmative action is morally acceptable.

Perhaps. But I share the skeptic's concerns here, and am not sure that even perfectly ideal reasoners would agree about every moral issue. So let's accept, at least for the moment, that premise 2 is true. What of premise 1?

That premise must be false. There are counterexamples galore. Brilliant physicists disagree about whether the fundamental elements of matter are subatomic strings; eminent archaeologists disagree about how to interpret the remains discovered at ancient sites; the finest philosophers continue to debate whether God exists. And yet there are objective truths in each area. There are objective truths about the fundamental nature of the physical world, about the nature of various prehistoric tribes, about whether there is or isn't a God. Gaining knowledge of these truths can be hard, and perhaps, in cases, impossible. But our beliefs on these matters must answer to an objective reality. Our views don't make physical or archaeological or philosophical claims true; the facts are what they are, independently of what we think of them.

There is another reason to doubt premise 1: this premise is itself the subject of deep disagreement. Really smart people still argue about whether it is true. And so, if such disagreement is enough to undermine objective truth, then the premise, by its own lights, can't be objectively true! And it certainly isn't "relatively" true—true just because I, or my society, believe in it. The premise, then, is false.

So deep disagreement, even among the best minds, is not enough to show that skepticism in an area is correct. As a result, the many disagreements we see in ethics are perfectly compatible with its objectivity.

7. Atheism Undermines Moral Objectivity

Recall (from chapter 5) the famous claim of Ivan Karamazov, one of Dostoevsky's finest creations: if God is dead, then everything is permitted. His guiding thought is that true morality can exist only if God underwrites its authority. Morality is a sham if God does not exist, because the only way morality could rest on solid foundations is by being authored by God.

Some atheists have taken up this line of thinking and have used it to justify moral skepticism. If they are right, and God does not exist, then morality can't possibly be objective. The Argument from Atheism expresses this outlook:

1. Morality can be objective only if God exists.
2. God does not exist.
3. Therefore, morality cannot be objective.

I'm going to make things much easier on myself by leaving that second premise alone. If it's false, and God exists, then the argument crumbles. But let's just assume for now that there is no God. Then what?

Well, if premise 1 is true, and objective morality really does depend on God, then moral skepticism is vindicated. Many people think that 1 is true. They reason as follows. Moral laws, like other laws, must have an author. But if the laws are objective, then (by definition) no human being can be their author. So who is? Three guesses.

This reasoning has always been very popular. But it is mistaken. It rests on this key assumption: laws require lawmakers. Suppose this assumption is true. It then follows that objective laws need lawmakers, too. But human beings cannot play this role, since objective truths are true independently of human opinion. That leaves only God to do the work.

But if atheism is true, then the crucial assumption is false. Laws would not require lawmakers. Atheists believe that there are objective laws—of logic, physics, genetics, statistics, and so on. And yet if God does not exist, these laws have no author. We discovered these laws. We invented the words to describe the laws. But they are not true because we believe them to be. Their truth is objective, not subjective. If atheists are correct, no one authored such laws.

Thus if atheism is true, objective laws do not require lawmakers. So, for all we know, objective moral laws do not require a lawmaker, either.

Atheists might say, though, that moral laws require lawmakers, even though other laws do not. But why single out morality like that? Surely we'd need an excellent reason for thinking that most objective laws need no author, though moral ones do.

4. For much more on this line of reasoning, see the extended discussion in chapter 5, pp. 64–68.
Perhaps there is an explanation of this difference. But we can't just assume there is. For atheists who think so, they must point to something special about morality that requires its laws to have an author, even though all other objective laws lack one.

Until they do, we must think that the Argument from Atheism is unpersuasive. It will obviously do nothing to convince religious believers, since it just assumes (in premise 2) that they are wrong. But even if atheists are correct, and God does not exist, premise 1 is highly doubtful, because its best support is flawed. That support comes from the assumption that laws require lawmakers—an assumption that atheists themselves should not accept.

8. The Absence of Categorical Reasons Undermines Moral Objectivity

Most people think that all moral duties come prepackaged with a special power. They automatically supply people with reasons to obey them. And it doesn't matter what we care about. If it's really your duty to repay that loan or help your aged grandparents, then you've got an excellent reason to do so—even if doing these things fulfills none of your desires.

That's unusual. My reasons for writing this book, using my treadmill, or listening to music, all depend on what matters to me. Most reasons are like this. The reasons that come from morality, however, are categorical. They apply to us regardless of what we care about.\(^5\)

Many philosophers cannot see how categorical reasons are possible. Their puzzlement has given rise to a powerful Argument from Categorical Reasons against ethical objectivism:

1. If there are objective moral duties, then there are categorical reasons to obey them.
2. There are no categorical reasons.
3. Therefore, there are no objective moral duties.

This argument has convinced some very smart philosophers. And they may be right to be convinced. But for those with objectivist leanings, there are two lines of response. Since the argument is logically perfect, objectivists have to reject either premise 1 or premise 2.

Some challenge premise 1. They deny that objective moral duties must supply us with reasons for action. It may be that some people have no reason to do what morality requires of them. Whether there are objective moral standards is one thing; whether they supply us with reasons to obey them is another. The answer to the first question may be yes, even if the answer to the second is a disappointing no. If this line of thinking is right, then we will have to abandon the age-old hope of showing that everyone has reason to be moral.\(^6\)

The second strategy stands by premise 1, but rejects premise 2. On such a view, objective moral duties really do provide categorical reasons—and these reasons exist. There are reasons to behave in certain ways, even if such behavior doesn't benefit us or satisfy any of our desires.

To make this reply a success, we must reject the most popular view of reasons. This view says that you have a reason to do something only if doing it will promote self-interest or get you what you care about.

The best way to criticize this popular view is by example. (Recall the discussion in chapter 8, pp. 111-12.) Suppose you are hiking along a cliff path and notice a stranger who is absent-mindedly walking in the opposite direction. You see that he's about to take a wrong step and plunge to his death. There is a reason to yell to him and alert him of the danger. And that reason applies to you even if you don't care a bit about the man or about the pats on the back you'll receive when the story gets out. There is something to be said on behalf of your warning him, something that favors it, that justifies it, that makes it a legitimate thing to do. These are just different ways of saying the same thing: there is an excellent reason for you to save that stranger's life, even if doing so won't make you any better off or get you anything you care about.

In short, those who believe that morality is objective must show either that its duties do not have to supply categorical reasons, or argue that such reasons exist. Many philosophers nowadays are developing these strategies, though just as many others (surprise!) are working to ensure that they do not succeed.

---

5. For detailed discussion of categorical reasons, see chapter 11, pp. 162-63.

6. If this line can be defended, then we also have an adequate reply to error theorists. They claim that moral thinking assumes the existence of categorical reasons, but that no such reasons exist. But if morality does not make that assumption, then it may be in good shape even if there are no categorical reasons.
9. Moral Motivation Undermines Moral Objectivity

Ask yourself this question: if you sincerely judge an action to be your duty, aren't you automatically motivated (at least a little bit) to do it? If you think a plan or a policy is a morally good one, aren't you moved to some extent to help it along? If you answered yes, then you share the belief that moral judgments are motivational by their very nature. Their essence is to move people to act.

It's not just a coincidence or some kind of minor miracle that moral judgments so reliably move us to act. They have this power because, at their core, what they do is express the very things that cause us to act—our desires, cares, commitments, and emotions. When we judge an action wrong, we are expressing our distaste or hatred of it, our desire that it not be done, our concern for those who might be harmed by it. Our moral judgments express our feelings, and our feelings are our basic motivations. That is why our moral judgments are so easily able to get us to act.

Contrast this picture with another one. Beliefs, unlike moral judgments, are not really in the business of getting us to act in certain ways. They are focused on stating the facts, on reporting the truth, on describing reality. If I believe that there is a computer monitor in front of me, two cats nearby, and an Oriental rug underfoot, I am not moved to act in any way at all. If I want to use the Internet, pet my cats, or vacuum the carpet, then these beliefs will help to direct my actions. But the key here is that beliefs can do this only by attaching themselves to my desires. If I didn't want to use the Internet, pet my cats, or vacuum my rug, then none of these beliefs would have helped at all in guiding my actions.

This contrast between moral judgment, on the one hand, and belief, on the other, inspired David Hume to construct the following Motivational Argument. Generations of moral skeptics have found it compelling:

1. Moral judgments are able, all by themselves, to motivate those who make them.
2. Beliefs are never able, all by themselves, to motivate those who hold them.
3. Therefore, moral judgments are not beliefs.
4. If moral judgments are not beliefs, then they can't be true.
5. Therefore, moral judgments can't be true.

Have a look at that conclusion. Unlike the previous eight arguments, this one doesn't say explicitly that ethical objectivism is false. But that will be cold comfort to the objectivist. If the conclusion of this argument is correct, then moral judgments can't be true. And if they can't be true, then they can't be objectively true. And if they can't be objectively true, then ethical objectivism is false.

Of the three premises in this argument, number 4 is pretty secure. If moral judgments are not beliefs, then they are expressions of plans, orders, commitments, desires, or emotions. Such expressions are not true or false. Suppose that I say that slavery is evil. And suppose that I am not thereby stating a belief, but rather expressing my emotions or commitments. What I'm really saying is "Don't enslave people!" or "Slavery—grrrr." These statements aren't true (or false). So if moral judgments are not beliefs, then they can't be true.

That leaves only two ways for objectivists to fight back against this argument. They can try to undermine the first premise, or the second. Unsurprisingly, objectivists have done both.

Some objectivists criticize 1, while accepting 2. They say that moral judgments are beliefs; beliefs cannot motivate all by themselves; and therefore moral judgments cannot motivate all by themselves. Moral judgments, like all beliefs, need a supplemental desire in order to move people to action.

These objectivists begin with an assumption: it's possible that sincere moral judgments leave us entirely cold. True, since most people have moral concerns and want (at least a little) to be moral, moral judgments will motivate most of the people who make them. But some people just don't care about morality. They judge things right or wrong and yet are completely unmoved. And that shows that premise 1 is false. Moral judgments cannot move people all by themselves.

Some objectivists take a different approach. They accept 1 and reject 2. So they insist that beliefs alone can motivate people to act. But clearly, not just any belief could do that. My belief that three plus three equals six, or that Peru is in South America, won't move me to do a thing. But evaluative beliefs—beliefs that tell us what is good and bad, or right and wrong—may be able, all by themselves, to get us to act. If they can, then premise 2 is false.

7. Recall the lesson about such expressions from the previous chapter's discussion of expressivism, p. 313.
8. These people are known as amoralists. Please see the discussion in the previous chapter, pp. 315–16, and in chapter 14, pp. 201–05, for more on amoralism.
Kant was one of those who rejected premise 2. Recall his claim (in chapter 12, pp. 174–75) that the good will involves only our reason, and not our desires or emotions. Reason tells us that something is our duty, and on the basis of that belief alone, we are motivated to do it. As Kant admitted, it isn't clear whether anyone has ever really acted from a good will, and so acted without the aid of any desires.

These issues are still very much at the center of discussion among philosophers. Objectivists will be able to defeat the Motivational Argument only if they can show that (a) moral beliefs can motivate all by themselves, or (b) they can't, but that this is okay, since not all moral judgments end up motivating people anyway.

10. Values Have No Place in a Scientific World

One of the tools that philosophers use when choosing between competing theories is called Occam's razor, after the medieval logician William of Occam (1285–1349). Occam's razor tells us never to multiply entities beyond necessity. What this means in practice is simple. When trying to separate fact from fiction, consider something to be real only if you need to assume its existence in order to explain what happens in the world.

Occam's razor explains why we shouldn't believe in such things as ghosts. Anything they might account for—spooky feelings in graveyards, creaking noises in old houses—can be better explained without assuming that ghosts really exist. Ghosts aren't needed to make sense of what we experience. So Occam's razor tells us that they don't exist.

Many people think that objective values are just like ghosts—creatures of our imagination. These critics deny that we really need to rely on moral features in order to explain the way the world works. Science is our path to understanding the nature of reality. And scientists never have to include moral features in their explanations of molecular structure, biological adaptations, heat transfer—or anything else. Calling something moral or immoral seems like a kind of luxury, one that adds nothing to understanding the ultimate nature of reality.

We can summarize this line of thinking in the Argument from the Scientific Test of Reality:

1. If science cannot verify the existence of X, then the best evidence tells us that X does not exist.
2. Science cannot verify the existence of objective moral values.

3. Therefore, the best evidence tells us that objective moral values do not exist.

This argument reflects a basic commitment to the idea that the supernatural does not exist, and that everything in the world can ultimately be explained by science. Since scientific investigation does not tell us whether actions are moral or immoral, good or evil, this seems to leave objective morality out in the cold.

Ethical objectivists have offered two replies to this argument. The first reply accepts premise 1, but rejects 2. Those who adopt this strategy believe that science is the ultimate test of reality, and also believe that morality can pass scientific muster. Other objectivists are doubtful of that, and so reject premise 1. Let's consider these in turn.

Many objectivists are so impressed with science and its potential for illuminating the nature of our world that they insist that morality be scientifically respectable. Such objectivists must therefore find a place for moral values within a scientific world.

They do this by arguing that moral features are nothing other than ordinary, run-of-the-mill qualities that science can tell us about. We use a different vocabulary to refer to them—we talk of good and evil, right and wrong, rather than neutrinos and quarks and molecules and proteins. But the words we use are not important. What is important is that, as these thinkers see it, the natural world is the only world there is. So moral features must be part of that world if they are to exist. This kind of view is called moral naturalism.

Moral naturalists could claim, for instance, that being morally right is nothing other than maximizing happiness, or that being good is the very same thing as being desired. We can use scientific means to check whether happiness is maximized, or whether people really desire things. On this view, moral features are nothing but a special class of scientific features. There isn't anything mysterious about them. Moral naturalists thus reject premise 2 of the argument, because they think that moral features just are natural (that is, not supernatural) features of our world.

If that is right, then moral values will need to pass the Occam's razor test of reality. Recall that this test tells us that we have reason to believe in things only if they are essential to explaining things. That's why we no longer believe in ghosts (or the tooth fairy or Superman). We have reason to think that physical objects like buildings or apples or planes are real, because their existence best explains why we see and taste and hear what we do.
But are moral features really needed to explain anything? Naturalists say yes. They think, for instance, that Stalin's evil nature is what explains his sending millions to their death in prison camps. The wrongness of slavery explains why slaves and abolitionists opposed it. The injustice of child abuse explains our anger when we learn of it, the child's resentment, and our efforts to protect children from it.

Many are doubtful that we really need to rely on moral features to explain the goings-on of our world. They think, for instance, that we don't need to refer to Stalin's evil nature in order to explain why so many ended up in the Gulag. Instead, we can refer to his beliefs, fears, plans, and desires to explain why he undertook such actions. We could morally evaluate such things if we like, but that wouldn't be essential to explaining why Stalin did what he did. Moral features are wholly optional and unnecessary when trying for the best, most rigorous explanation of why we act as we do, and have the experiences we have.

Objectivists who share these doubts about naturalism thus accept premise 2 of the current argument. They agree that science cannot verify the existence of objective moral values. These objectivists must therefore criticize premise 1, and its claim that science is the ultimate measure of reality.

Their best strategy is to draw our attention to the fact that moral features are normative features. Normative features are those that tell us how things ought to be, or how we should behave. They rely on norms: standards of behavior that supply us with ideals or requirements.

The basic idea behind rejecting premise 1 is this. Science tells us how things really are. Science does not tell us how things ought to be. Science describes; morality prescribes. Science has its limits. It is out of its depth when trying to tell us about our ultimate purpose, the goals we ought to aim for, the standards we should live by. Science can tell us a lot. But it can't tell us everything.

There is some reason to deny that science really does have the final word on everything. Consider this:

(T) A claim is true only if science can verify it.

(T) can't be true. For science cannot verify it. (T) is not a scientific statement. We cannot test its truth by analyzing what we see, hear, taste, feel, or smell. We cannot mathematically test it. There are no lab experiments that will confirm it.

Since (T) is false, it follows that there are some truths that science cannot confirm. Perhaps moral ones are among them.

Now consider this principle:

(B) You are justified in believing a claim only if science can confirm it.

(B) is also problematic, since science cannot confirm it. Only philosophy can do that. If we take (B) at face value, then by its own lights we cannot be justified in thinking that it is true. So we are not justified in thinking that science is the source of all truths.

This line of reply does not prove that objective moral values exist. But if successful, it does show that science cannot have the final say about everything. This means that at least some nonscientific claims are true, and perhaps highly credible. Moral claims may be among them.

**Conclusion**

Our discussion of these ten arguments has not revealed a single one that confirms the existence of objective moral values. That was deliberate. I had given over the previous two chapters to the critics of objectivism, and showed how each of the anti-objectivist theories encounters some serious problems.

It's only fair, then, that we devote some time to the many worries that people have about how morality could possibly be objective. I have tried here to outline the ones that are either very popular or very threatening. The most popular ones actually seem easiest to handle. The less well known arguments strike me as more difficult to rebut.

There is no quick, knockdown argument that will demolish ethical objectivism. Nor is there any short and sweet proof of its truth. I have offered these arguments, and their replies, not in order to create the impression of a victory for either side, but rather to give you a sense of how complicated things can get in this area of philosophy. Those who act as if moral skepticism were obviously true, or just plainly false, have simply gotten it wrong. Matters here, as elsewhere in ethics, are too challenging to admit of pat and easy solutions.

**Discussion Questions**

1. How might one be an ethical objectivist without being intolerant or dogmatic?
2. What is the best explanation of the existence of widespread disagreement in ethics? Does the existence of disagreement suggest a lack of objective moral truth?
3. What are categorical reasons? Do any categorical reasons exist? If not, does this undermine the claim that morality is objective?
4. Do you think that it is possible to make a moral judgment, but to be completely unmotivated to act on it? How does this question bear on the matter of morality’s objectivity?
5. At the end of the day, do you believe that morality is objective? What do you think is the strongest argument in favor of your position?

Where to Start

Most of the topics covered in these pages are also represented in the companion volume to this book, *The Ethical Life: Fundamental Readings in Ethics and Moral Problems*, 2nd ed. (Oxford University Press). That book provides selections of original work by other philosophers. I chose the pieces there with an eye to the introductory student, so most of the material should be fairly accessible to those just beginning their philosophical studies. If you want a relatively short collection that ranges over the main issues discussed here, plus a lot of coverage of specific moral problems, such as abortion, the death penalty, and animal rights, then that might be a good place to start.*

An excellent source for the entire range of philosophical issues, not just those in ethics, is the Stanford Encyclopedia of Philosophy, a free online resource containing articles written by experts in the field: http://plato.stanford.edu/. The articles are usually pitched to those with little prior knowledge of the topic under discussion.

There are a number of other texts designed to introduce students to the field of moral philosophy. Among the better ones are the following: James Rachels and Stuart Rachels, *The Elements of Moral Philosophy*, 6th ed. (McGraw-Hill 2009); Mark Timmons, *Moral Theory* (Rowman and Littlefield, 2001); and Julia Driver, *Ethics: The Fundamentals* (Blackwell, 2006). Of these, the Rachels and Rachels book is best suited for those with

no philosophy background. The Driver and the Timmons books are a bit more advanced.

Three very good anthologies provide fairly accessible survey articles of the major theories in and about ethics. One of these is A Companion to Ethics (Blackwell, 1991), edited by Peter Singer. Another is The Blackwell Guide to Ethical Theory (Blackwell, 2000), edited by Hugh LaFollette. The last is The Oxford Handbook of Ethical Theory (Oxford University Press, 2007), edited by David Copp. The Encyclopedia of Ethics (Garland, 1992), edited by Lawrence and Charlotte Becker, is available in most college and university libraries and offers entries on all of the topics covered in this book.

Hedonism

Epicurus's works are available in many editions. A reliable and well-priced version is The Epicurus Reader, edited by L. Gerson and B. Inwood (Hackett, 1994). His Letter to Menoeceus, included in that collection, summarizes the main doctrines of his philosophy. W. D. Ross's two-worlds objection to hedonism can be found in The Right and the Good (Oxford University Press, 1930), chapter 5. Robert Nozick's experience machine discussion can be found in his Anarchy, State, and Utopia (Basic Books, 1974), pp. 42-45. John Stuart Mill's version of hedonism is presented in chapters 2 and 4 of Utilitarianism (many publishers). Jeremy Bentham's version of hedonism can be found in his Introduction to the Principles of Morals and Legislation (1781), available from many publishers. Perhaps the most sophisticated contemporary defense of hedonism is offered by Fred Feldman in his very clearly written Pleasure and the Good Life (Oxford University Press, 2006). A defense of the view that informed and autonomous happiness is the key to a good life is given by L. W. Sumner in his Welfare, Happiness, and Ethics (Oxford University Press, 1995). His book also provides a nice overview of the issues surrounding the nature of the good life.

A very accessible, engaging work for introductory students is Joel Kupperman's Six Myths about the Good Life (Hackett, 2006), which covers hedonism, the desire theory, and other options not discussed here. Those who want more in the way of short selections from classic texts in this area might consult The Good Life, edited by Charles Guignon (Hackett, 1999). On hedonism and happiness more generally, see Nicholas White's historical survey A Brief History of Happiness (Blackwell, 2006), and Steven Cahn and Christine Vitrano's anthology Happiness: Classic and Contemporary Readings in Philosophy (Oxford University Press, 2007).

Getting What You Want

James Griffin's Well-Being (Oxford University Press, 1985), part 1, provides a good discussion of the various difficulties surrounding the desire satisfaction theory, but also offers a qualified defense of the view. The view that the satisfaction of our filtered, more informed desires is the basis of personal welfare is defended by John Rawls, A Theory of Justice (Harvard University Press, 1971), pp. 417ff.; Richard Brandt in A Theory of the Good and the Right (Oxford University Press, 1979), pp. 126-29; and Peter Railton, "Facts and Values," included in his collection of important essays, Facts, Values, and Norms (Cambridge University Press, 2003).

A lovely critical discussion of the desire view, with lots of examples meant to damage it and to provide indirect support for his own more Aristotelian view, can be found in Richard Kraut's What Is Good and Why? (Harvard University Press, 2007), chapter 2. Another excellent critical discussion, though less accessible, is Connie Rosati's "Persons, Perspectives, and Full Information Accounts of the Good," Ethics 105 (1995): 296-325. An absolutely delightful book, chock full of real-life stories and interesting examples, is Jean Kazez's The Weight of Things (Blackwell, 2006). She defends an objective view about well-being in chapters 5 and 6.

Morality and Religion

Plato's Euthyphro is available in many translations. At about eleven pages, it's an enjoyable introduction to Plato's early work. Perhaps your best bet is to get it packaged with four other Platonic dialogues in an excellent, inexpensive translation by G. M. A. Grube and John Cooper, Five Dialogues (Hackett, 2001).
Defenses of the divine command theory tend to be fairly complex and difficult. A pretty accessible version is by the late Philip Quinn, in his article on the theory in Hugh LaFollette’s (ed.) *The Blackwell Guide to Ethical Theory* (2000). Robert Adams is another notable defender of the theory. His work is not easy for the beginner, but “A New Divine Command Theory,” *Journal of Religious Ethics* 7 (1979): 66–79, might not be a bad place to start. A more accessible version of this paper is given in an anthology that I have edited, which ranges across most areas of ethics: *Ethical Theory: An Anthology*, 2nd ed. (Blackwell, 2011).

Though it focuses on many other issues as well, *God? A Debate Between a Christian and an Atheist* (Oxford University Press, 2004), written by William Lane Craig (the Christian) and Walter Sinnott-Armstrong (the atheist), also contains some common lines of defense and criticism surrounding the divine command theory. It is written in a very lively style. Accessible assessments of the divine command theory can be found in most of the introductory books mentioned in the “Where to Start” section at the beginning of Suggestions for Further Reading. A critical discussion of the divine command theory that is quite easy to read can be found in Erik Weilenberg’s *Value and Virtue in a Godless Universe* (Cambridge University Press, 2005), chapter 2. Kai Nielsen’s *Ethics without God* (Prometheus, 1990) is a clear treatment of a number of issues regarding religion and morality, written from the perspective of someone who thinks that ethics is self-standing and has no need of religious input.

**Natural Law**

The attempt to base morality on human nature can be traced in the West all the way to Aristotle. His *Nicomachean Ethics*, especially books I and II, are the place to start. A fine and helpful translation is offered by Terence Irwin (Hackett, 1999, 2nd ed.). Medieval philosopher Thomas Aquinas, whose work continues to exercise the largest influence on Roman Catholic moral theology, is the essential source for thinking about developments of natural law over the past 700 years. Aquinas isn’t that approachable; you could dip a toe into the water by having a look at Question 94 of the Prima Secundae of his *Summa Theologica*. The *Summa* runs to five volumes and over a thousand pages, but this discussion can be found in almost every shorter collection of Aquinas’s works. A good book for beginners is *Aquinas: Selected Writings* (Penguin, 1999), edited by Ralph McInerny.

Important contemporary natural lawyers include John Finnis, whose *Natural Law and Natural Rights* (Oxford University Press, 1980) did much to revive this ethical tradition within secular academic circles. A good scholarly history can be found in Knud Haakonssen’s *Natural Law and Moral Philosophy: From Grotius to the Scottish Enlightenment* (Cambridge University Press, 1996). *Philippa Foot’s Natural Goodness* (Oxford University Press, 2001) is a delightfully written book by a very important moral philosopher.

**Psychological Egoism**

Though it is nowadays the subject of some debate among scholars, it seems that Thomas Hobbes committed himself to psychological egoism in several passages of his masterpiece, *Leviathan*. This work is available from many publishers; if you have an ear for seventeenth-century English, you will love Hobbes’s vigorous style. Joseph Butler, an eighteenth-century bishop, produced criticisms of psychological egoism that many still regard as decisive. See his *Fifteen Sermons Preached at the Rolls Chapel*, the relevant portions of which are presented in *Five Sermons* (Hackett, 1983), edited by Stephen Darwall. David Hume, a master stylist himself, also criticized psychological egoism in appendix 2 of his *Enquiry Concerning the Principles of Morals*, available from many publishers.

**Ethical Egoism**

What I have called “The Best Argument for Ethical Egoism” can be pieced together from claims made by Thomas Hobbes in *his Leviathan*. The claim that we have reason to do only what will serve self-interest is defended by David Gauthier in his important (but difficult) book *Morals by Agreement* (Oxford University Press, 1986), chapter 2. A crystal-clear
historical survey of this thesis about reasons is given in Robert Shaver's *Rational Egoism* (Cambridge University Press, 1999).

Ayn Rand has defended ethical egoism in many of her books. An accessible and short version of her influential views can be found in her article “The Ethics of Emergencies,” reprinted in her collection *The Virtue of Selfishness* (Penguin, 1963).

Consequentialism

John Stuart Mill's *Utilitarianism* is the place to start. It is short and elegant; many editions are available. Perhaps the greatest utilitarian treatise ever written is Henry Sidgwick's *The Methods of Ethics* (1907; also available from many publishers). Sidgwick's writing style does not endear him to the reader, however—especially the introductory reader. R. M. Hare's writing style, by contrast, is clean and elegant; his sophisticated defense of utilitarianism can be found in his *Moral Thinking* (Oxford University Press, 1981).

There are several good collections of articles and book excerpts on the subject of consequentialism. The contents usually reflect work being done by and for fellow philosophers, so the going isn't always easy. Perhaps the one that contains the greatest bang for the buck for the introductory student is Jonathan Glover's *Utilitarianism and Its Critics* (Prentice Hall, 1990). Samuel Scheffler's *Consequentialism and Its Critics* (Oxford University Press, 1988) contains many fine articles, but the going is sometimes quite difficult. Stephen Darwall does a nice job collecting classic readings and important contemporary ones in his *Consequentialism* (Blackwell, 2002).

Kantian Ethics

Kant's writing is not at all easy to work through. The most accessible (or rather, least inaccessible) of his works is also the shortest: *The Groundwork of the Metaphysics of Morals*. It comes in at a bit under sixty pages; parts 1 and 2 (there are three parts in all) can occasionally be read with pleasure and ready comprehension. The best translation is offered by Mary Gregor, with an excellent introduction by Christine Korsgaard (Cambridge University Press, 1998). The translations of Lewis White Beck and H. G. Paton are also good. Paul Guyer's *Kant's Groundwork of the Metaphysics of Morals: A Reader's Guide* (Continuum, 2007) is a helpful book to have by one's side when reading this classic text. For the intrepid reader who wants more Kant than this, try his *Metaphysics of Morals*, also translated by Mary Gregor (Cambridge University Press, 1996).

Social Contract Theory

Thomas Hobbes's *Leviathan* is the place to start. For those with only a relatively short amount of time on their hands, go directly to chapters
13–15, and then keep reading as time permits. John Locke's *Second Treatise of Government* and Jean-Jacques Rousseau's *The Social Contract* (both available in many editions) are also important classics in this tradition. Locke's short book was especially influential in the thinking of the authors of the Declaration of Independence and the U.S. Constitution.

The Hobbesian approach to morality is given an important and sophisticated update by David Gauthier, in his *Morals by Agreement* (Oxford University Press, 1986). Gregory Kavka's *Hobbesian Moral and Political Theory* (Princeton University Press, 1986) is wonderful both as commentary and as good, clear-headed philosophy.

John Rawls's *A Theory of Justice* (Harvard University Press, 1971; rev. ed. 1999) was recognized as a masterpiece upon its publication. A shorter presentation of his central ideas can be found in *Justice as Fairness: A Restatement* (Harvard University Press, 2001, 2nd ed.). Rawls's theory is, as its title suggests, a theory of justice rather than a theory about the whole of morality. Still, its influence in ethics, as well as in social and political philosophy, would be difficult to overstate.

T. M. Scanlon's very important ethical theory, which he terms "contractualism," is a contemporary offshoot of the social contract theory. He presents it in his book *What We Owe to Others* (Harvard University Press, 1998). It's long and rarely an easy go for the beginner; those who want a briefer introduction to his thinking are advised to have a look at his paper "Contractualism and Utilitarianism," included in a collection edited by Amartya Sen and Bernard Williams, *Utilitarianism and Beyond* (Cambridge University Press, 1982), pp. 103–28.

A nice collection of excerpts and essays from social contract theorists is offered by Stephen Darwall, ed., *Contractarianism/Contractualism* (Blackwell, 2002).

**Ethical Pluralism**

A nice collection of articles, some in defense of absolutism and others critical of it, can be found in Joram Haber, ed., *Absolutism and Its Critics* (Rowman and Littlefield, 1994). An unusual introduction to ethics, one that contains a number of pieces that focus on the Doctrine of Double Effect and the Doctrine of Doing and Allowing, is *Ethics: Problems and Principles* (Wadsworth, 1992), edited by John Martin Fischer and Mark Ravizza.

A very interesting piece that renewed interest in the DDE and DDA is Philippa Foot's "Abortion and the Doctrine of Double Effect," *Oxford Review* 5 (1967): 5–15. Foot introduced the now-famous trolley problem to the philosophy literature, as well as numerous other examples that have stimulated philosophical discussion for the past several decades. See also Judith Jarvis Thomoson's articles "The Trolley Problem" and "Killing, Letting Die, and the Trolley Problem," both reprinted in her marvelous collection *Rights, Restitution, and Risk* (Harvard University Press, 1986). Thomson introduces a number of important variations on Foot's example and argues for anticonsequentialist principles meant to explain why it is only sometimes, and not always, permitted to minimize harm.

Stephen Darwall's collection, *Deontology* (Blackwell, 2002), contains a number of important papers that explore the idea that certain kinds of actions are intrinsically right or wrong, and discuss the question of whether there are any absolute moral rules.

**Virtue Ethics**

Study of virtue ethics must begin with Aristotle's *Nicomachean Ethics*. Many good translations are available. In addition to the one by Terence Irwin, mentioned in the "Natural Law" section, the one undertaken by our old friend W. D. Ross, the preeminent Aristotle scholar of his day, is also excellent. It has been updated by J. O. Urmson and J. L. Ackrill (Oxford University Press, 1998). Christopher Rowe has also provided a fine translation, aided by Sarah Broadie's substantial and illuminating notes, in their edition of the *Nicomachean Ethics* (Oxford University Press, 2002).
The Blackwell Guide to Aristotle's Nicomachean Ethics (Blackwell, 2006), edited by Richard Kraut, is highly recommended. It includes instructive articles on many important aspects of Aristotle's ethical thought by a who's who of leading scholars.

The best short overview of virtue ethics that I have read is by Julia Annas, in her contribution to David Copp's *The Oxford Handbook of Ethical Theory* (Oxford University Press, 2007).

Two excellent collections on virtue ethics are Stephen Darwall, ed., *Virtue Ethics* (Blackwell, 2002), and Michael Slote and Roger Crisp, eds., *Virtue Ethics* (Oxford University Press, 1997).

The Ethics of Feminism

A good place to start is Hilde Lindemann’s *An Invitation to Feminist Ethics* (McGraw-Hill, 2006), written with nonphilosophers and beginning students in mind. Its first chapter provides a nice, brief overview of feminist ethics, while chapter 4 offers a succinct review of feminist criticisms of utilitarianism, Kantianism, and contractarianism. But the entire book is worth a read.

Those with an interest in the ethics of care should start with Carol Gilligan's fascinating *In a Different Voice* (Harvard University Press, 1982), and proceed to Nel Noddings' *Caring: A Feminine Approach to Ethics and Moral Education* (University of California Press, 1984). Two recent studies by important philosophers are Michael Slote's *The Ethics of Care and Empathy* (Routledge, 2007) and Virginia Held’s *The Ethics of Care: Personal, Political, Global* (Oxford University Press, 2007). Those who want a much briefer, but still substantial treatment of the subject, would do well to have a look at Held’s "The Ethics of Care," in *The Oxford Handbook of Ethical Theory* (Oxford University Press, 2007), edited by David Copp.

For a taste of the many moral issues that receive fresh light when seen from a feminist perspective, you might try *Feminist Philosophies* (Prentice Hall, 1992), edited by Janet Kourany, James Sterba, and Rosemary Tong. Cheshire Calhoun’s collection, *Setting the Moral Compass: Essays by Women Philosophers* (Oxford University Press, 2004), includes essays by a roster of outstanding philosophers writing on issues in and around feminist philosophy.

The Status of Morality

Most of the work done in metaethics is not that accessible for beginning students. I have written a very elementary introduction to metaethics, titled *Whatever Happened to Good and Evil?* (Oxford University Press, 2004), designed for those with no prior philosophy knowledge. Robert Audi’s *Moral Value and Human Diversity* (Oxford University Press, 2007) is also pitched to an introductory audience. For a more advanced treatment, Alexander Miller’s *An Introduction to Contemporary Metaethics* (Polity, 2004) is a valuable resource. A historically informed survey of views on the topic is given by Stephen Darwall in his *Philosophical Ethics* (Westview, 1997).

The early chapters of Book III of David Hume’s *Treatise of Human Nature* have set the terms of the debate in metaethics for the past two and a half centuries. Hume’s work has inspired important contemporary philosophers such as Gilbert Harman, whose own engagingly written introduction to ethics, *The Nature of Morality* (Oxford University Press, 1977), contains (in its first two chapters) the most influential version of the Argument from the Scientific Test of Reality, discussed in chapter 21. Harman is also the most prominent contemporary moral relativist. His paper "Moral Relativism Defended," *Philosophical Review* 85 (1975): 3–22, is worth seeking out. It and four other interesting essays in defense of relativism are included in his *Explaining Value* (Oxford University Press, 2000).

Expressivism entered the scene in the 1930s with chapter 6 of A. J. Ayer's *Language, Truth, and Logic*. This is well worth a read, as Ayer pulls no punches and is a lovely writer. Simon Blackburn's work is the most accessible among contemporary expressivists, though written with fellow philosophers in mind. His *Essays in Quasi-Realism* (Oxford University Press, 1993) contains many important papers. But a better place to start would be his introduction to philosophy, *Think* (Oxford University Press, 1999), chapter 8, which is more accessible and written with his characteristic elegance.

For a defense of ethical objectivism that is as clear as philosophical writing gets, see David Brink, *Moral Realism and the Foundations of Ethics* (Cambridge University Press, 1989). Brink is a moral naturalist whose book offers detailed coverage of most of the major issues in metaethics.

For a wide-ranging collection containing many classic and contemporary writings on the subject, along with a dozen substantial introductory essays designed with the student reader in mind, see Terence Cuneo and Russ Shafer-Landau, eds., *Foundations of Ethics: An Anthology* (Blackwell, 2006).

**GLOSSARY**

**Absolute:** Never permissibly broken; violating an absolute moral rule is always wrong.

**Act consequentialism:** The normative ethical theory that says that an act is morally right just because it produces the best actual or expected results.

**Act utilitarianism:** The version of act consequentialism that says that only well-being is intrinsically valuable, and so says that an act is morally right just because it maximizes overall well-being.

**Ad hominem attack:** An attempt to undermine the position of an opponent by criticizing his motives or character.

**Agnostics:** Those who suspend judgment on the question of whether God exists.

**Altruism:** The direct care and concern to improve the well-being of someone other than yourself.

**Ambiguous:** Having two or more meanings.

**Amoralists:** Those who do not care about living up to the moral views they sincerely hold.

**Argument:** Any chain of thought in which premises are enlisted in support of a particular conclusion.

**Atheism:** The belief that God does not exist.

**Autonomy:** The capacity to determine for yourself the principles that you will live by. It can also refer to your ability to live according to your own plan of life.

**Begging the question:** Arguing on the basis of a reason that will appeal only to people who already accept the argument's conclusion.

**Categorical imperative:** A command of reason that requires a person's obedience regardless of whether such obedience gets him anything he wants.

**Categorical reason:** A reason to do something that applies to a person regardless of her desires.
Circular reasoning: Defending some belief by a set of other beliefs whose justification ultimately traces back to the original claim in question.

Coherentism: The view that we are justified in believing a claim to the extent that it supports, and is supported by, other beliefs we hold.

Conceptual truth: A true claim that can be known just by understanding it. Such a claim is true just by virtue of the concepts it contains—that's why understanding it enables one to know it. An example: bachelors are unmarried men.

Consent, tacit: See tacit consent.

Consequentialism: A family of normative ethical theories that share the idea that the morality of actions, policies, motives, or rules depends on their producing the best actual or expected results. See also: act consequentialism, rule consequentialism, act utilitarianism, rule utilitarianism.

Continent: Doing the right thing while suppressing desires that tempt one away from doing one's duty.

Contractarianism: See social contract theory.

Cultural relativism: The view that an act is morally right just because it is allowed by the guiding ideals of the society in which it is performed, and immoral just because it is forbidden by those ideals.

Decision procedure: Any method designed to guide us in successfully deliberating about what to do.

Deist: One who believes that God exists, created the universe, and then refrained from becoming involved in human affairs.

Desire satisfaction theory: A theory of human well-being that claims that the satisfaction of your actual or informed desires is necessary and sufficient to improve your welfare.

Divine Command Theory: The view that an act is morally required just because it is commanded by God, and immoral just because God forbids it.

Doctrine of Doing and Allowing (DDA): The view that it is always morally worse to do harm than to allow that same harm to occur.

Doctrine of Double Effect (DDE): The view that if your goal is worthwhile, you are sometimes permitted to act in ways that foreseeably cause certain harms, though you must never intend to cause those harms.

Dogmatism: The trait of being closed-minded and unreasonably confident of the truth of one's views.

Empirical truth: A true claim that can be known only by means of evidence gained through the senses. Understanding what such a claim says is not enough to know whether it is true—you have to check the claim "against the world" to test it. An example: the Empire State Building is 1453 feet tall.

Error theory: The metaethical view that there are no moral features in this world; no moral judgments are true; our sincere moral judgments try, and always fail, to describe the moral features of things; and there is no moral knowledge.

Ethical egoism: The normative ethical theory that says that actions are morally right just because they maximize self-interest.

Ethical monism: The view that there is only one moral rule that is absolute and fundamental.

Ethical objectivism: The view that there is at least one objective moral standard.

Ethical particularism: The view that there are neither any absolute nor any prima facie moral rules. According to ethical particularism, no feature of the world is always morally relevant, and none is always morally decisive.

Ethical pluralism: The view that there are at least two, and possibly more, fundamental moral rules.

Ethical relativism: The view that correct moral standards are relative to individual or cultural commitments. Ethical relativism can take two forms: cultural relativism or ethical subjectivism.

Ethical subjectivism: The view that an act is morally right just because (a) I approve of it, or (b) my commitments allow it. An action is wrong just because (a) I disapprove of it, or (b) my commitments forbid it.

Eudaimonia: The state of living well; happiness, or flourishing.

Evaluative beliefs: Beliefs that evaluate something, and so assess it as good or bad, virtuous or vicious, and so on.

Exemplar, moral: See moral exemplar.

Exemplary punishment: Punishment designed to make an example of the one who is punished.

Expressivism: The version of moral nihilism that denies that there are any moral features in this world; claims that there is nothing for moral judgments to be true of; and analyzes moral judgments as expressions of emotions, orders, or commitments, none of which are the sorts of things that can be true or false.

Fact-value distinction: The view that there is a sharp difference between facts and values; value claims are not factual, and so cannot be true.

Feminist ethics: A family of theories that emphasize the moral equality of women, and the importance of attending to women's experience in the development of moral ideas and ideals.

Fidelity: Being faithful to one's word; keeping one's promises.

Fitness: The level of an organism's ability to survive and reproduce.

Free-rider problem: A situation in which people are able to obtain a share of some common good without contributing to it. In such situations, it appears to be rational (if your withholding can go unnoticed) to refrain from contributing, thus enjoying the good at no expense to yourself. The problem is that if enough people act rationally, then there will not be enough resources to produce the relevant good, thus harming everyone.

Fundamental: A moral rule is fundamental just in case its justification does not depend on any more general or more basic moral rule.
**Golden rule**: The normative ethical principle that says that your treatment of others is morally acceptable if and only if you would be willing to be treated in exactly the same way.

**Good will**: The ability to reliably determine what your duty is, and a steady commitment to do your duty for its own sake.

**Hedonism**: The view that pleasure is the only thing that is intrinsically valuable, and pain (or unhappiness) is the only thing that is intrinsically bad.

**Hypothetical imperative**: A command of reason that requires a person to take the needed means to getting what she wants.

**Ideal observers**: Those (probably imaginary) people who are fully informed, perfectly rational, and otherwise perfectly suited to determine the content of morality.

**Imperative, categorical**: See categorical imperative.

**Imperative, hypothetical**: See hypothetical imperative.

**Individual relativism**: See ethical subjectivism.

**Infinite regress**: An unending series of claims, each of which justifies a previous one and requires justification by a subsequent one. Because the chain never ends, none of the claims within it is ultimately justified.

**Innate**: Congenital. Innate traits are inborn traits, as opposed to traits that are acquired after birth.

**Instrumental goods**: Those things whose value consists in the fact that they help to bring about other good things. Examples include vaccinations, mothballs, and money.

**Intrinsic values**: Those things that are good in and of themselves, considered entirely apart from any good results they may cause. It is controversial which things are intrinsically valuable, but happiness, desire satisfaction, virtue, and knowledge are frequently mentioned candidates.

**Lex talionis**: The law of retaliation, the principle that says that a wrongdoer deserves to be treated just as he treated his victim.

**Logical validity**: The feature of an argument that indicates that its premises logically support its conclusion. Specifically, an argument is logically valid just because its conclusion must be true if its premises were all true. Another way to put this: logically valid arguments are those in which it is impossible for all premises to be true while the conclusion is false.

**Maxim**: A principle of action that you give to yourself. It contains your intended action and the reason you are doing it.

**Metaethics**: The area of ethical theory that asks about the status of normative ethical claims. It asks, for instance, about whether such claims can be true and, if so, whether personal, cultural, or divine opinion makes them true (or none of the above). It also considers issues about how to gain moral knowledge (if we can), and whether moral requirements give us reasons to obey them.

**Metaphysics**: The branch of philosophy that discusses the nature of reality, what exists, and what does not exist.

**Monism, ethical**: See ethical monism.

**Moral agent**: One who can guide his or her behavior by means of moral reasoning, and so someone who is fit for praise or blame.

**Moral community**: The set of those beings whose interests are intrinsically important. Membership signifies that you are owed respect, that you have moral rights, that others owe you moral duties for your own sake.

**Moral exemplar**: Someone of outstanding moral character; someone who can serve as a proper moral role model.

**Moral luck**: A case in which the morality of an action or a decision depends on factors outside of our control.

**Moral naturalism**: The view that moral features are natural (i.e., not supernatural) features, whose existence can be confirmed by means of the natural sciences.

**Moral nihilism**: The form of moral skepticism that says that the world contains no moral features, and so there is nothing for moral claims to be true of. Its two major forms are the error theory and expressivism.

**Moral skepticism**: The view that there are no objective moral standards. Moral skepticism is also sometimes taken to refer to the view that we can have no moral knowledge.

**Moral worth**: The praiseworthy feature of an action that fulfills one's moral duty.

**Natural law theory**: The normative ethical view that says that actions are right if and only if they are natural, and wrong if and only if they are unnatural; people are good to the extent that they fulfill their true nature, bad insofar as they do not.

**Nonmaleficence**: Not harming others.

**Norm**: A standard of evaluation. Norms tell us how we should or ought to behave. They represent a measure that we are to live up to.

**Normative ethics**: The area of ethical theory focused on identifying which kinds of actions are right and wrong, examining the plausibility of various moral rules, and determining which character traits qualify as virtues and which as vices.

**Normative features**: Those features that tell us how things ought to be, or how we should behave. They rely on norms to do this.

**Objective moral duties**: Those moral requirements that apply to people regardless of their opinions about such duties, and independently of whether fulfilling such duties will satisfy any of their desires.

**Objective theory of well-being**: There are many such theories, all sharing a common feature—they claim that certain things are good for people whether or not they believe them to be and whether or not such things satisfy a person's actual or informed desires.

**Occam's razor**: The instruction never to multiply entities beyond necessity. In the context of selecting from among competing theories, it tells us to choose that theory that can explain as much as any other, while making the fewest assumptions.
G-6 Glossary

Omniscient: All-knowing.
Optimific: Producing the best possible results.
Optimific social rule: A rule whose general acceptance within a society would yield better results than any other such rule.
Paternalism: The policy of treating mature people as if they were children. More specifically, it is a policy of limiting someone's liberty, against his will, for his own good.
Pluralism, ethical: See ethical pluralism.
Premise: Any reason that is used within an argument to support a conclusion.
Prima facie duty: A permanent, excellent but nonabsolute reason to do (or refrain from) a certain type of action.
Principle of Humanity: Kant's thesis that one must always treat a human being (oneself included) as an end, and never as a mere means.
Principle of Universalizability: Kant's thesis that an act is morally acceptable if, and only if, its maxim is universalizable.
Principle of utility: The ultimate utilitarian moral standard, which says that an action is morally right if and only if it does more to improve overall well-being than any other action you could have done in the circumstances.
Prisoner's dilemma: A situation in which everyone involved would be better off by reducing his or her pursuit of self-interest.
Proceduralism: The view that says that we must follow a certain procedure in order to determine which actions are morally right, or which moral claims are true.
Psychological egoism: The view that all human actions are motivated by self-interest, and that altruism is impossible.
Punishment, exemplary: See exemplary punishment.
Punishment, vicarious: See vicarious punishment.
Relativism, cultural: See cultural relativism.
Relativism, individual: See ethical subjectivism.
Rule consequentialism: The normative ethical theory that says that actions are morally right just because they would be required by an optimific social rule.
Rule utilitarianism: The version of rule consequentialism that says that well-being is the only thing of intrinsic value.
Self-evident: A claim is self-evident just in case it is true, and adequately understanding it is enough to make you justified in believing it. The best candidates for self-evident claims are conceptual truths.
Self-regarding actions: Actions that affect only oneself.
Social contract theory: A view in political philosophy that says that governmental power is legitimate if and only if it would be accepted by free, equal, and rational people intent on selecting principles of cooperative living. Also, a view in normative ethical theory that says that actions are morally right if and only if they are permitted by rules that free, equal, and rational people would agree to live by, on the condition that others obey these rules as well.

Soundness: A special feature of some arguments. Sound arguments are ones that (1) are logically valid, and (2) contain only true premises. This guarantees the truth of their conclusions.
Standard of rightness: A rule that gives conditions that are both necessary and sufficient for determining whether actions (or other things) are morally right.
State of nature: A situation in which there is no central authority with the exclusive power to enforce its will on others.
Strictly conscientious action: Action motivated by the thought or the desire to do one's duty for its own sake, rather than from any ulterior motive.
Supererogation: Praiseworthy actions that are above and beyond the call of duty.
Tacit consent: Agreement that is expressed through silence or inaction.
Theist: One who believes that God exists.
Universalizability: The feature of a maxim that indicates that every rational person can consistently act on it. Here is the three-part test for a maxim's universalizability: (1) carefully frame the maxim; (2) imagine a world in which everyone shares and acts on that maxim; (3) determine whether the goal within the maxim can be achieved in such a world. If so, the maxim is universalizable. If not, it isn't.
Validity: See logical validity.
Value theory: The area of ethics concerned with identifying what is valuable in its own right, and explaining the nature of well-being.
Veil of ignorance: An imaginary device that removes all knowledge of one's social, economic, and religious positions; one's personality traits; and other distinguishing features. It is designed to ensure that the important choices of social contractors are made fairly.
Vicarious punishment: The deliberate punishment of innocent victims, designed to deter third parties.
Vicious: Possessed of many vices. The opposite of virtuous.
Virtue ethics: A normative ethical theory that says that an action is morally right just because it would be done by a virtuous person acting in character.
